

MTConnect[®] Standard

Part 1.0 – Fundamentals

Version 2.2.0

Prepared for: MTConnect Institute
Prepared from: MTConnectSysMLModel.xml
Prepared on: August 8, 2023

MTConnect[®] is a registered trademark of AMT - The Association for Manufacturing Technology. Use of MTConnect is limited to use as specified on <http://www.mtconnect.org/>.

MTConnect Specification and Materials

The Association for Manufacturing Technology (AMT) owns the copyright in this MTConnect Specification or Material. AMT grants to you a non-exclusive, non-transferable, revocable, non-sublicensable, fully-paid-up copyright license to reproduce, copy and redistribute this MTConnect Specification or Material, provided that you may only copy or redistribute the MTConnect Specification or Material in the form in which you received it, without modifications, and with all copyright notices and other notices and disclaimers contained in the MTConnect Specification or Material.

If you intend to adopt or implement an MTConnect Specification or Material in a product, whether hardware, software or firmware, which complies with an MTConnect Specification, you shall agree to the MTConnect Specification Implementer License Agreement (“Implementer License”) or to the MTConnect Intellectual Property Policy and Agreement (“IP Policy”). The Implementer License and IP Policy each sets forth the license terms and other terms of use for MTConnect Implementers to adopt or implement the MTConnect Specifications, including certain license rights covering necessary patent claims for that purpose. These materials can be found at www.MTConnect.org, or by contacting <mailto:info@MTConnect.org>.

MTConnect Institute and AMT have no responsibility to identify patents, patent claims or patent applications which may relate to or be required to implement a Specification, or to determine the legal validity or scope of any such patent claims brought to their attention. Each MTConnect Implementer is responsible for securing its own licenses or rights to any patent or other intellectual property rights that may be necessary for such use, and neither AMT nor MTConnect Institute have any obligation to secure any such rights.

This Material and all MTConnect Specifications and Materials are provided “as is” and MTConnect Institute and AMT, and each of their respective members, officers, affiliates, sponsors and agents, make no representation or warranty of any kind relating to these materials or to any implementation of the MTConnect Specifications or Materials in any product, including, without limitation, any expressed or implied warranty of noninfringement, merchantability, or fitness for particular purpose, or of the accuracy, reliability, or completeness of information contained herein. In no event shall MTConnect Institute or AMT be liable to any user or implementer of MTConnect Specifications or Materials for the cost of procuring substitute goods or services, lost profits, loss of use, loss of data or any incidental, consequential, indirect, special or punitive damages or other direct damages, whether under contract, tort, warranty or otherwise, arising in any way out of access, use or inability to use the MTConnect Specification or other MTConnect Materials, whether or not they had advance notice of the possibility of such damage.

1 1 Overview of MTConnect

2 MTConnect is a data and information exchange standard that is based on a *data dictionary*
3 of terms describing information associated with manufacturing operations. The standard
4 also defines a series of *semantic data model* that provide a clear and unambiguous repre-
5 sentation of how that information relates to a manufacturing operation. The MTConnect
6 Standard has been designed to enhance the data acquisition capabilities from equipment in
7 manufacturing facilities, to expand the use of data driven decision making in manufactur-
8 ing operations, and to enable software applications and manufacturing equipment to move
9 toward a plug-and-play environment to reduce the cost of integration of manufacturing
10 software systems.

11 The MTConnect standard supports two primary communications methods - *request and*
12 *response* and *publish and subscribe* type of communications. The *request and response*
13 communications structure is used throughout this document to describe the functionality
14 provided by MTConnect. See *Section 5.1.3.1 - Streaming Data* for details describing the
15 functionality of the *publish and subscribe* communications structure available from an
16 *agent*.

17 Although the MTConnect Standard has been defined to specifically meet the requirements
18 of the manufacturing industry, it can also be readily applied to other application areas as
19 well.

20 The MTConnect Standard is an open, royalty free standard – meaning that it is available
21 for anyone to download, implement, and utilize in software systems at no cost to the
22 implementer.

23 The *semantic data models* defined in the MTConnect Standard provide the information re-
24 quired to fully characterize data with both a clear and unambiguous meaning and a mech-
25 anism to directly relate that data to the manufacturing operation where the data originated.
26 Without a *semantic data model*, client software applications must apply an additional layer
27 of logic to raw data to convey this same level of meaning and relationship to manufacturing
28 operations. The approach provided in the MTConnect Standard for modeling and organiz-
29 ing data allows software applications to easily interpret data from a wide variety of data
30 sources which reduces the complexity and effort to develop applications.

31 The data and information from a broad range of manufacturing equipment and systems
32 are addressed by the MTConnect Standard. Where the *data dictionary* and *semantic data*
33 *models* are insufficient to define some information within an implementation, an imple-
34 menter may extend the *data dictionary* and *semantic data model* to address their specific
35 requirements. See *Section D - Extensibility* for guidelines related to extensibility of the
36 MTConnect Standard.

37 To assist in implementation, the MTConnect Standard is built upon the most prevalent
38 standards in the manufacturing and software industries. This maximizes the number of
39 software tools available for implementation and provides the highest level of interoper-
40 ability with other standards, software applications, and equipment used throughout manu-
41 facturing operations.

42 Current MTConnect implementations are based on HTTP as a transport protocol and XML
43 as a language for encoding each of the *semantic data models* into electronic documents.
44 All software examples provided in the various MTConnect Standard documents are based
45 on these two core technologies.

46 The base functionality defined in the MTConnect Standard is the *data dictionary* describ-
47 ing manufacturing information and the *semantic data model*. The transport protocol and
48 the programming language used to represent or transfer the information provided by the
49 *semantic data models* are not restricted in the standard to HTTP and XML. Therefore,
50 other protocols and programming languages may be used to represent the semantic models
51 and/or transport the information provided by these data models between an *agent* (server)
52 and a client software application as may be required by a specific implementation.

53 Note: The term “document” is used with different meanings in the MTCon-
54 nect Standard:

- 55 • Meaning 1: The MTConnect Standard itself is comprised of multiple documents
56 each addressing different aspects of the Standard. Each document is referred to as a
57 Part of the Standard.
- 58 • Meaning 2: In an MTConnect implementation, the electronic documents that are
59 published from a data source and stored by an *agent*.
- 60 • Meaning 3: In an MTConnect implementation, the electronic documents generated
61 by an *agent* for transmission to a client software application.

62 The following will be used throughout the MTConnect Standard to distinguish between
63 these different meanings for the term “document”:

- 64 • MTConnect Document(s) or Document(s) shall be used to refer to printed or elec-
65 tronic document(s) that represent a Part(s) of the MTConnect Standard.
- 66 • All reference to electronic documents that are received from a data source and stored
67 in an *agent* shall be referred to as *document(s)* and are typically provided with a
68 prefix identifier; e.g. asset document.

- 69 • All references to electronic documents generated by an *agent* and sent to a client
 70 software application shall be referred to as a *response document*.

71 When used with no additional descriptor, the form “document” shall be used to refer to
 72 any printed or electronic document.

73 Manufacturing software systems implemented utilizing MTConnect can be represented by
 74 a very simple structure as shown in Figure 1.

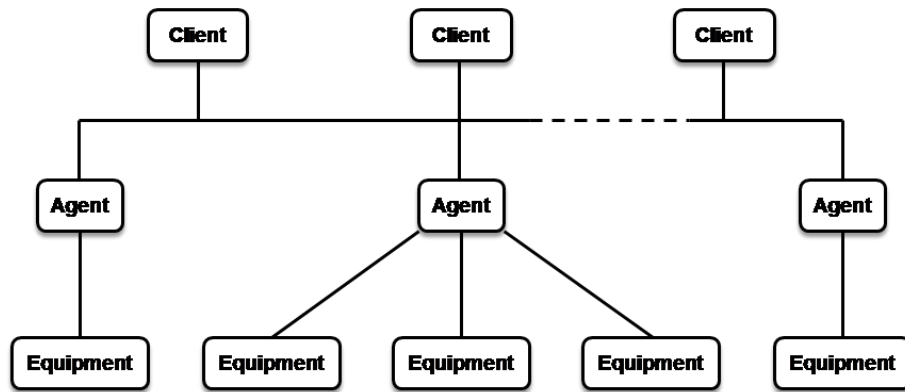

Figure 1: Basic MTConnect Implementation Structure

75 The three basic modules that comprise a software system implemented using MTConnect
 76 are:

- 77 • **Equipment:** Any data source. In the MTConnect Standard, equipment is defined as
 78 any tangible property that is used to equip the operations of a manufacturing facil-
 79 ity. Examples of equipment are machine tools, ovens, sensor units, workstations,
 80 software applications, and bar feeders.

- 81 • **Agent:** Software that collects data published from one or more piece(s) of equip-
 82 ment, organizes that data in a structured manner, and responds to requests for data
 83 from client software systems by providing a structured response in the form of a
 84 *response document* that is constructed using the *semantic data models* defined in the
 85 Standard.

86 Note: The *agent* may be fully integrated into the piece of equipment or
 87 the *agent* may be independent of the piece of equipment. Implementation
 88 of an *agent* is the responsibility of the supplier of the piece of equipment
 89 and/or the implementer of the *agent*.

- 90 • **Client Software Application:** Software that requests data from *agents* and processes
 91 that data in support of manufacturing operations.

92 Based on Figure 1, it is important to understand that the MTConnect Standard only ad-
93 dresses the following functionality and behavior of an *agent*:

94 • the method used by a client software application to request information from an
95 *agent*.

96 • the response that an *agent* provides to a client software application.

97 • a *data dictionary* used to provide consistency in understanding the meaning of data
98 reported by a data source.

99 • the description of the *semantic data models* used to structure *response documents*
100 provided by an *agent* to a client software application.

101 These functions are the primary building blocks that define the base functional structure
102 of the MTConnect Standard.

103 There are a wide variety of data sources (equipment) and data consumption systems (client
104 software systems) used in manufacturing operations. There are also many different uses
105 for the data associated with a manufacturing operation. No single approach to implement-
106 ing a data communication system can address all data exchange and data management
107 functions typically required in the data driven manufacturing environment. MTConnect
108 has been uniquely designed to address this diversity of data types and data usages by pro-
109 viding different *semantic data models* for different data application requirements:

110 • **Data Collection:** The most common use of data in manufacturing is the collection
111 of data associated with the production of products and the operation of equipment
112 that produces those products. The MTConnect Standard provides comprehensive
113 *semantic data models* that represent data collected from manufacturing operations.
114 These *semantic data models* are detailed in *MTConnect Standard: Part 2.0 - Device*
115 *Information Model* and *MTConnect Standard: Part 3.0 - Observation Information*
116 *Model* of the MTConnect Standard.

117 • **Inter-operations Between Pieces of Equipment:** The MTConnect Standard provides
118 an *interaction model* that structures the information required to allow multiple pieces
119 of equipment to coordinate actions required to implement manufacturing activities.
120 This *interaction model* is an implementation of a *request and response* messaging
121 structure. This *interaction model* is called `Interfaces` which is detailed in *MT-*
122 *Connect Standard: Part 5.0 - Interface Interaction Model* of the MTConnect Stan-
123 dard.

- 124 • Shared Data: Certain information used in a manufacturing operation is commonly
125 shared amongst multiple pieces of equipment and/or software applications. This
126 information is not typically “owned” by any one manufacturing resource. The MT-
127 Connect Standard represents this information through a series of *semantic data mod-*
128 *els* – each describing different types of information used in the manufacturing en-
129 vironment. Each type of information is called an *Asset*. *Assets* are detailed in *MT-*
130 *Connect Standard: Part 4.0 - Asset Information Model*, and its sub-Parts, of the
131 MTConnect Standard.

132 **2 Purpose of This Document**

133 This document, *MTConnect Standard Part 1.0 - Fundamentals* of the MTConnect Stan-
134 dard, addresses two major topics relating to the MTConnect Standard. The first sections of
135 the document define the organization of the documents used to describe the MTConnect
136 Standard; including the terms and terminology used throughout the Standard. The balance
137 of the document defines the following:

- 138 • Operational concepts describing how an *agent* should organize and structure data
139 that has been collected from a data source.
- 140 • Definition and structure of the *response documents* supplied by an *agent*.
- 141 • The protocol used by a client software application to communicate with an *agent*.

142 3 Terminology and Conventions

143 This section provides a dictionary of terms, reserved language, and document conventions
144 used in the MTConnect Standard.

145 3.1 General Terms

146 *adapter*

147 optional piece of hardware or software that transforms information provided by a
148 piece of equipment into a form that can be received by an *agent*.

149 *agent*

150 software that collects data published from one or more piece(s) of equipment, or-
151 ganizes that data in a structured manner, and responds to requests for data from
152 client software systems by providing a structured response in the form of a *response*
153 *document* that is constructed using the *semantic data model* of a Standard.

154 *alarm limit*

155 limit used to trigger warning or alarm indicators.

156 *application*

157 software or a program that is specific to the solution of an application problem.
158 *Ref ISO/IEC 20944-1:2013*

159 *archetype*

160 *archetype* provides the requirements, constraints, and common properties for a type
161 of *Asset*.

162 *asset buffer*

163 *buffer* for *Assets*.

164 *attachment*

165 connection by which one thing is associated with another.

166 *buffer*

167 section of an *agent* that provides storage for information published from pieces of
168 equipment.

169 ***cartesian coordinate system***

170 3D orthogonal coordinate system [(ISO/IEC 19794-5:2011)en].

171 ***characteristic***172 control placed on an element of a *feature* such as its size, location, or form, which
173 may be a specification limit, a nominal with tolerance, or some other numerical or
174 non-numerical control. *Ref QIF 3.0 3.4.29. Ref AS9102-B.*175 ***client***176 *application* that sends *request* for information to an *agent*.177 Note: Examples include software applications or a function that imple-
178 ments the *request* portion of an *interface interaction model*.179 ***combined standard uncertainty***180 *standard uncertainty* of the result of a measurement when that result is obtained
181 from the values of a number of other quantities, equal to the positive square root of a
182 sum of terms, the terms being the variances or covariances of these other quantities
183 weighted according to how the measurement result varies with changes in these
184 quantities. *Ref JCGM 100:2008 2.3.4*185 ***controlled vocabulary***

186 restricted set of values that may be published for an observation.

187 ***data dictionary***188 listing of standardized terms and definitions used in *MTCConnect Information Model*.189 ***data model***190 organizes elements of data and standardizes how they relate to one another and to
191 the properties of real-world entities.192 ***data set***193 *key-value pairs* where each entry is uniquely identified by the *key*.194 ***data source***195 piece of equipment that can produce data that is published to an *agent*.196 ***deprecated***197 indication that specific content in an *MTCConnect Document* is currently usable but
198 is regarded as being obsolete or superseded.

199 ***deprecation warning***

200 indication that specific content in an *MTConnect Document* may be changed to *depre-*
201 *recated* in a future release of the standard.

202 ***document***

203 piece of written, printed, or electronic matter that provides information or evidence
204 that serves as an official record.

205 ***electric current***

206 rate of flow of electric charge.

207 ***element***

208 constituent part or a basic unit of identifiable and definable data.

209 ***extensible***

210 ability for an implementer to extend *MTConnect Information Model* by adding con-
211 tent not currently addressed in the MTConnect Standard.

212 ***feature***

213 topological entity(ies) or design requirements related to a geometric model. *Ref QIF*
214 *3.0-3.4.59*

215 ***force***

216 push or pull on a mass which results in an acceleration.

217 ***heartbeat***

218 function that indicates to a *client* that the communications connection to an *agent* is
219 still viable during times when there is no new data available to report often referred
220 to as a “keep alive” message.

221 ***higher level***

222 nested element that is above a lower level element.

223 ***implementation***

224 specific instantiation of the MTConnect Standard.

225 ***information model***

226 rules, relationships, and terminology that are used to define how information is struc-
227 tured.

228 ***instance***

229 describes a set of *streaming data* in an *agent*. Each time an *agent* is restarted with
230 an empty *buffer*, data placed in the *buffer* represents a new *instance* of the *agent*.

231 ***interaction model***

232 model that defines how information is exchanged across an *interface* to enable in-
233 teractions between independent systems.

234 ***interface***

235 means by which communication is achieved between independent systems.

236 ***key***

237 unique identifier in a *key-value pair* association.

238 ***key-value pair***

239 association between an identifier referred to as the *key* and a value which taken
240 together create a *key-value pair*.

241 ***location***

242 place or named space associated with an object or that can be occupied by an object.

243 ***lower camel case***

244 first word is lowercase and the remaining words are capitalized and all spaces be-
245 tween words are removed.

246 ***lower level***

247 nested element that is below a higher level element.

248 ***lower limit***

249 lower conformance boundary for a variable.

250 ***lower warning***

251 lower boundary indicating increased concern and supervision may be required.

252 ***major***

253 identifier representing a consistent set of functionalities defined by the MTConnect
254 Standard.

255 ***maximum***

256 numeric upper constraint.

257 ***message***

258 communication in writing, in speech, or by signals.

259 ***metadata***

260 data that provides information about other data.

261 ***minimum***

262 numeric lower constraint.

263 ***minor***

264 identifier representing a specific set of functionalities defined by the MTConnect
265 Standard.

266 ***nominal***

267 ideal or desired value for a variable.

268 ***organize***

269 act of containing and owning one or more elements.

270 ***organizer***

271 entity that *organizes* one or more elements.

272 ***parameter***

273 variable that must be given a value during the execution of a program or a commu-
274 nications command.

275 ***part***

276 discrete item that has both defined and measurable physical characteristics including
277 mass, material, and features, and is created by applying one or more manufacturing
278 process steps to a workpiece

279 ***pascal case***

280 first letter of each word is capitalized and the remaining letters are in lowercase. All
281 space is removed between letters

282 ***persistence***

283 method for retaining or restoring information.

284 ***position***

285 *location* that is represented by a point in space relative to a reference.

286 ***probe***

287 instrument commonly used for measuring the physical geometrical characteristics
288 of an object.

289 ***profile***

290 extends a reference metamodel (such as Unified Modeling Language (UML)) by
291 allowing to adapt or customize the metamodel with constructs that are specific to a
292 particular domain, platform, or a software development method.

293 ***requester***

294 entity that initiates a *request* for information in a communications exchange.

295 ***reset***

296 act of reverting back the accumulated value or statistic to their initial value.

297 Note: An *Observation* with a *data set* representation removes all *key-*
298 *value pairs*, setting the *data set* to an empty set.

299 ***responder***

300 entity that responds to a *request* for information in a communications exchange.

301 ***response document***

302 electronic *document* published by an *MTCConnect Agent* in response to a *probe re-*
303 *quest, current request, sample request* or *asset request*.

304 ***revision***

305 supplemental identifier representing only organizational or editorial changes to a
306 *minor* version document with no changes in the functionality described in that doc-
307 ument.

308 ***schema***

309 definition of the structure, rules, and vocabularies used to define the information
310 published in an electronic document.

311 ***semantic data model***

312 methodology for defining the structure and meaning for data in a specific logical
313 way that can be interpreted by a software system.

314 ***sensing element***

315 mechanism that provides a signal or measured value.

316 ***sequence number***

317 primary key identifier used to manage and locate a specific piece of *streaming data*
318 in an *agent*.

319 ***specification limit***

320 limit defining a range of values designating acceptable performance for a variable.

321 ***spindle***

322 mechanism that provides rotational capabilities to a piece of equipment.

323 Note: Typically used for either work holding, materials or cutting tools.

324 ***standard***

325 *document* established by consensus that provides rules, guidelines, or characteristics
326 for activities or their results.. *Ref ISO/IEC Guide 2:2004*

327 ***standard uncertainty***

328 *uncertainty* of the result of a measurement expressed as a standard deviation. *Ref JCGM*
329 *100:2008 2.3.1*

330 ***stereotype***

331 defines how an existing UML metaclass may be extended as part of a *profile*.

332 ***subtype***

333 secondary or subordinate type of categorization or classification of information.

334 ***table***

335 two dimensional set of values given by a set of *key-value pairs table entries*.

336 ***table cell***

337 subdivision of a *table entry* representing a singular value.

338 ***table entry***

339 subdivision of a *table* containing a set of *key-value pairs* representing *table cells*.

340 ***top level***

341 element that represents the most significant physical or logical functions of a piece
342 of equipment.

343 ***type***

344 classification or categorization of information.

345 ***uncertainty***

346 uncertainty (of measurement) parameter, associated with the result of a measure-
347 ment, that characterizes the dispersion of the values that could reasonably be at-
348 tributed to the measurand. *Ref JCGM 100:2008 2.2.3*

349 Note: Use of the term uncertainty refers to uncertainty of measurement.

350 ***upper limit***

351 upper conformance boundary for a variable.

352 ***upper warning***

353 upper boundary indicating increased concern and supervision may be required.

354 ***version***

355 unique identifier of the administered item. *Ref ISO/IEC 11179-:2015*

356 **3.2 Information Model Terms**357 ***Asset Information Model***

358 *information model* that provides semantic models for *Assets*.

359 ***Device Information Model***

360 *information model* that describes the physical and logical configuration for a piece
361 of equipment and the data that may be reported by that equipment.

362 ***Error Information Model***

363 *information model* that describes the *response document* returned by an *agent* when
364 it encounters an error while interpreting a *request* for information from a *client* or
365 when an *agent* experiences an error while publishing the *response* to a *request* for
366 information.

367 ***MTCConnect Information Model***

368 *information model* that defines the semantics of the MTCConnect Standard.

369 ***Observation Information Model***

370 *information model* that describes the *streaming data* reported by a piece of equip-
371 ment.

372 3.3 Protocol Terms

373 ***asset request***

374 *HTTP Request* to the *agent* regarding *Assets*.

375 ***current request***

376 *request* to an *agent* to produce an *MTConnectStreams Response Document* contain-
377 ing the *Observation Information Model* for a snapshot of the latest observations at
378 the moment of the *request* or at a given *sequence number*.

379 ***data streaming***

380 method for an *agent* to provide a continuous stream of information in response to a
381 single *request* from a *client*.

382 ***MTConnect Request***

383 *request* for information issued from a *client* to an *MTConnect Agent*.

384 ***MTConnect Response Document***

385 *response document* published by an *MTConnect Agent*.

386 ***MTConnectAssets Response Document***

387 *response document* published by an *MTConnect Agent* in response to an *asset re-*
388 *quest*.

389 ***MTConnectDevices Response Document***

390 *response document* published by an *MTConnect Agent* in response to a *probe re-*
391 *quest*.

392 ***MTConnectErrors Response Document***

393 *response document* published by an *MTConnect Agent* whenever it encounters an
394 error while interpreting an *MTConnect Request*.

395 ***MTConnectStreams Response Document***

396 *response document* published by an *MTConnect Agent* in response to a *current re-*
397 *quest* or a *sample request*.

398 ***probe request***

399 *request* to an *agent* to produce an *MTConnectDevices Response Document* contain-
400 ing the *Device Information Model*.

401 ***protocol***

402 set of rules that allow two or more entities to transmit information from one to the
403 other.

404 ***publish***

405 sending of messages in a *publish and subscribe* pattern.

406 ***publish and subscribe***

407 asynchronous communication method in which messages are exchanged between
408 applications without knowing the identity of the sender or recipient.

409 Note: In the MTConnect Standard, a communications messaging pattern
410 that may be used to publish *streaming data* from an *agent*.

411 ***request***

412 communications method where a *client* transmits a message to an *agent*. That mes-
413 sage instructs the *agent* to respond with specific information.

414 ***request and response***

415 communications pattern that supports the transfer of information between an *agent*
416 and a *client*.

417 ***response***

418 response *interface* which responds to a *request*.

419 ***sample request***

420 *request* to an *agent* to produce an *MTConnectStreams Response Document* contain-
421 ing the *Observation Information Model* for a set of timestamped observations made
422 by *Components*.

423 ***streaming data***

424 observations published by a piece of equipment defined by the equipment metadata.

425 ***subscribe***

426 receiving messages in a *publish and subscribe* pattern.

427 ***transport protocol***

428 set of capabilities that provide the rules and procedures used to transport information
429 between an *agent* and a client software application through a physical connection.

430 3.4 HTTP Terms

431 ***HTTP Body***

432 data bytes transmitted in an HTTP transaction message immediately following the
433 headers. *Ref IETF:RFC-2616*

434 ***HTTP Error Message***

435 response provided by an *agent* indicating that an *HTTP Request* is incorrectly for-
436 matted or identifies that the requested data is not available from the *agent*. *Ref IETF:RFC-*
437 *2616*

438 ***HTTP Header***

439 header of either an *HTTP Request* from a *client* or an *HTTP Response* from an *agent*.
440 *Ref IETF:RFC-2616*

441 ***HTTP Header Field***

442 components of the header section of request and response messages in an HTTP
443 transaction. *Ref IETF:RFC-2616*

444 ***HTTP Message***

445 consist of requests from client to server and responses from server to client. *Ref IETF:RFC-*
446 *2616*

447 Note: In MTConnect Standard, it describes the information that is ex-
448 changed between an *agent* and a *client*.

449 ***HTTP Messaging***

450 *interface* for information exchange functionality. *Ref IETF:RFC-2616*

451 ***HTTP Method***

452 portion of a command in an *HTTP Request* that indicates the desired action to be
453 performed on the identified resource; often referred to as verbs. *Ref IETF:RFC-*
454 *2616*

455 ***HTTP Query***

456 portion of a request for information that more precisely defines the specific informa-
457 tion to be published in response to the request. *Ref IETF:RFC-2616*

458 ***HTTP Request***

459 request message from a client to a server includes, within the first line of that mes-
460 sage, the method to be applied to the resource, the identifier of the resource, and the
461 protocol version in use. *Ref IETF:RFC-2616*

462 Note: In MTConnect Standard, a request issued by a *client* to an *agent*
463 requesting information defined in the *HTTP Request Line*.

464 ***HTTP Request Line***

465 begins with a method token, followed by the Request-URI and the protocol version,
466 and ending with CRLF. A CRLF is allowed in the definition of TEXT only as part
467 of a header field continuation. *Ref IETF:RFC-2616*

468 Note: the first line of an *HTTP Request* describing a specific *response*
469 *document* to be published by an *agent*.

470 ***HTTP Request Method***

471 indicates the method to be performed on the resource identified by the Request-URI.
472 *Ref IETF:RFC-2616*

473 ***HTTP Request URI***

474 Uniform Resource Identifier that identifies the resource upon which to apply the
475 request. *Ref IETF:RFC-2616*

476 ***HTTP Response***

477 after receiving and interpreting a request message, a server responds with an HTTP
478 response message. *Ref IETF:RFC-2616*

479 Note: In MTConnect Standard, the information published from an *agent*
480 in reply to an *HTTP Request*.

481 ***HTTP Server***

482 server that accepts *HTTP Request* from *client* and publishes *HTTP Response* as a
483 reply to those *HTTP Request*. *Ref IETF:RFC-2616*

484 ***HTTP Status Code***

485 3-digit integer result code of the attempt to understand and satisfy the request.
486 *Ref IETF:RFC-2616*

487 ***HTTP Version***

488 version of the HTTP protocol. *Ref IETF:RFC-2616*

489 3.5 XML Terms

490 ***abstract element***

491 element that defines a set of common characteristics that are shared by a group of
492 elements. An abstract entity cannot appear in a document. In a specific implemen-
493 tation, an abstract entity is replaced by a derived element that is itself not an abstract
494 entity. The characteristics for the derived element are inherited from the abstract
495 entity.

496 ***attribute***

497 additional information or property for an *element*.

498 ***child element***

499 *element* of a data modeling structure that illustrates the relationship between itself
500 and the higher-level *parent element* within which it is contained.

501 ***document body***

502 portion of the content of an *MTCConnect Response Document* that is defined by the
503 relative *MTCConnect Information Model*. The *document body* contains the *structural*
504 *elements* and *Observations* or *DataItems* reported in a *response document*.

505 ***document header***

506 portion of the content of an *MTCConnect Response Document* that provides infor-
507 mation from an *agent* defining version information, storage capacity, protocol, and
508 other information associated with the management of the data stored in or retrieved
509 from the *agent*.

510 ***element name***

511 descriptive identifier contained in both the `start-tag` and `end-tag` of an XML
512 element that provides the name of the element.

513 ***namespace***

514 organizes information into logical groups.

515 ***parent element***

516 *element* of a data modeling structure that illustrates the relationship between itself
517 and the lower-level *child element*.

518 ***root element***

519 first *structural element* provided in a *response document* encoded using XML.

520 ***structural element***

521 *element* that organizes information that represents the physical and logical parts and
 522 sub-parts of a piece of equipment.

523 ***XML Document***

524 structured text file encoded using Extensible Markup Language (XML).

525 ***XML Schema***

526 *schema* defining a specific document encoded in XML.

527 **3.6 MTConnect Terms**528 ***Asset***

529 asset that is used by the manufacturing process to perform tasks.

530 Note 1 to entry: An *Asset* relies upon an *Device* to provide observations
 531 and information about itself and the *Device* revises the information to
 532 reflect changes to the *Asset* during their interaction. Examples of *Assets*
 533 are cutting tools, Part Information, Manufacturing Processes, Fixtures,
 534 and Files.

535 Note 2 to entry: A singular `assetId`, *Asset* uniquely identifies an
 536 *Asset* throughout its lifecycle and is used to track and relate the *Asset* to
 537 other *Devices* and entities.

538 Note 3 to entry: *Assets* are temporally associated with a device and can
 539 be removed from the device without damage or alteration to its primary
 540 functions.

541 ***Component***

542 engineered system part of a *Device* composed of zero or more *Components*

543 ***Composition***

544 *Component* belonging to a *Component* and not composed of any *Components*.

545 ***Configuration***

546 configuration for a *Component*

547 ***DataItem***

548 observable observed by a *Component* that may make *Observations*

549 ***Device***

550 *Component* not belonging to any *Component* that may have assets

551 ***MTCConnect Agent***

552 *agent* for the *MTCConnect Information Model*.

553 ***MTCConnect Document***

554 *document* that represents a Part(s) of the MTCConnect Standard.

555 ***MTCConnect Event***

556 observation of either a state or discrete value of the *Component*.

557 ***MTCConnect Interface***

558 *interaction model* for interoperability between pieces of equipment.

559 ***Observation***

560 observation that provides telemetry data for a *DataItem*.

561 **3.7 Acronyms**

562 ***2D***

563 two-dimensional

564 ***3D***

565 three-dimensional

893

894 4 Fundamentals

895 The MTConnect Standard defines the normative information model and protocol for re-
896 trieving information from manufacturing equipment. This document specifies the *agent*
897 behavior and protocol.

898 4.1 Agent

899 The MTConnect Standard specifies the minimum functionality of the *agent*. The function-
900 ality is as follows:

- 901 • Provides store and forward messaging middleware service.
- 902 • Provides key-value information storage and asset retrieval service.
- 903 • Implements the REST API for the MTConnect Standard (See *Section 5.1 - REST*
904 *Protocol*).
 - 905 – *Device* metadata.
 - 906 – observations collected by the agent.
 - 907 – assets collected by the agent.

908 There are three types of information stored by an *agent* that **MAY** be published in a *re-*
909 *sponse document*. These are as follows:

- 910 • equipment metadata specified in *MTConnect Standard: Part 2.0 - Device Informa-*
911 *tion Model*.
- 912 • *streaming data* provides the observations specified in *MTConnect Standard: Part*
913 *3.0 - Observation Information Model*.
- 914 • *Assets* specified in *MTConnect Standard: Part 4.0 - Asset Information Model*.

915 4.1.1 Agent Instance ID

916 The *agent* **MUST** set the `instanceId` to a unique value whenever the *sequence number*
917 in the agent is initialized to 1. (see *Section 4.1.3.1 - Sequence Numbers* and *Section 4.1.3.7*
918 *- Persistence and Recovery* below).

919 4.1.2 Storage of Equipment Metadata

920 An *agent* **MUST** be capable of publishing equipment metadata for the *agent* as specified
 921 in *MTConnect Standard: Part 2.0 - Device Information Model*.

922 4.1.3 Storage of Streaming Data

923 The *agent* **MAY** implement a *buffer* with a fixed number of observations. If the *buffer-*
 924 *Size* is fixed, the *agent* **MUST** store observations using a first-in-first-out pattern. The
 925 *agent* will remove the oldest observation when the *buffer* is full and a new observation
 926 arrives.

Figure 2: Data Storage in Buffer

927 In Figure 3, the maximum number of observations that can be stored in the *buffer* of the
 928 *agent* is 8. The *bufferSize* in the header reports the maximum number of observations.
 929 This example illustrates that when the *buffer* fills up, the oldest piece of data falls out the
 930 other end.

Figure 3: First In First Out Buffer Management

931 Note: As an implementation suggestion, the *buffer* should be sized large
 932 enough to provide a continuous stream of observations. The implementer
 933 should also consider the impact of a temporary loss of communications when
 934 determining the size for the *buffer*. A larger *buffer* will allow more time to
 935 reconnect to an *agent* without losing data.

936 4.1.3.1 Sequence Numbers

937 In an *agent*, each occurrence of an observation in the *buffer* will be assigned a mono-
 938 tonically increasing unsigned 64-bit integer (*sequence number*) when it arrives. The first
 939 *sequence number* **MUST** be 1.

940 The *sequence number* for each observation **MUST** be unique for an instance of an *agent*
 941 identified by an `instanceId`.

942 Table 1 illustrates the changing of the `instanceId` when an *agent* resets the *sequence*
 943 *number* to 1.

<code>instanceId</code>	<code>sequence</code>

	3
	4
	5

Table 1: `instanceId` and `sequence`

944 Figure 4 shows two additional pieces of information defined for an *agent*:

- 945 • `firstSequence` – the oldest observation in the *buffer*. The *agent* removes this
 946 observation when it receives the next observation
- 947 • `lastSequence` – the newest observation in the *buffer*

948 `firstSequence` and `lastSequence` provide the range of values for the REST API
 949 requests.

950 The *agent* **MUST** begin evaluating observations with *sample request*'s `from` parameter.
 951 Also, the *agent* **MUST** include a maximum number of observations given by the `count`
 952 parameter in the *response document*.

953 In Figure 5, the request specifies the observations start at *sequence number* 15 (`from`)
 954 and includes a total of three items (`count`).

Figure 4: Identifying the range of data with firstSequence and lastSequence

Figure 5: Identifying the range of data with from and count

955 nextSequence header property has the *sequence number* of the next observation in the
956 *buffer* for subsequent *sample requests* providing a contiguous set of observations. In the
957 example in Figure 5, the next *sequence number* (*nextSequence*) will be 18.

958 As shown in Figure 6, the combination of *from* and *count* defined by the *request* indi-
959 cates a *sequence number* for data that is beyond that which is currently in the *buffer*. In
960 this case, *nextSequence* is set to a value of *lastSequence* + 1.

Figure 6: Identifying the range of data with nextSequence and lastSequence

961 4.1.3.2 Observation Buffer

962 An observation has four pieces of information as follows:

- 963 1. *sequence number* associated with each observation - `sequence`.
- 964 2. The `timestamp` the observation was made. .
- 965 3. A reference to the `dataItemId` from the *MTConnect Standard: Part 2.0 - Device*
- 966 *Information Model*.
- 967 4. The value of the observation.

968 Table 2 is an example demonstrating the concept of how data may be stored in an *agent*:

<code>sequence</code>	<code>timestamp</code>	<code>dataItemId</code>	<code>result</code>
101	2016-12-13T09:44:00.2221Z	AVAIL-28277	UNAVAILABLE
102	2016-12-13T09:54:00.3839Z	AVAIL-28277	AVAILABLE
103	2016-12-13T10:00:00.0594Z	POS-Y-28277	25.348
104	2016-12-13T10:00:00.0594Z	POS-Z-28277	13.23
105	2016-12-13T10:00:03.2839Z	SS-28277	0
106	2016-12-13T10:00:03.2839Z	POS-X-28277	11.195
107	2016-12-13T10:00:03.2839Z	POS-Y-28277	24.938
108	2016-12-13T10:01:37.8594Z	POS-Z-28277	1.143
109	2016-12-13T10:02:03.2617Z	SS-28277	1002

Table 2: Data Storage Concept

969 **4.1.3.3 Timestamp**

970 observations **MUST** have a `timestamp` giving the most accurate time that the observa-
 971 tion occurred.

972 The timezone of the `timestamp` **MUST** be UTC (Coordinated Universal Time) and
 973 represented using ISO 8601 format: e.g., “2010-04-01T21:22:43Z”.

974 Applications **SHOULD** use the observation’s `timestamp` for ordering as opposed to
 975 *sequence number*.

976 All observations occurring at the same time **MUST** have the same `timestamp`.

977 4.1.3.4 Recording Occurrences of Streaming Data

978 The *agent* **MUST** only place observations in the *buffer* if the data has changed from the
979 previous observation for the same `DataItem`.

980 The *agent* **MUST** place every observation in the *buffer*, without checking for changes, in
981 the following cases:

- 982 • The `discrete` attribute is `true` for the `DataItem`.
- 983 • The `representation` is `DISCRETE`.
- 984 • The `representation` is `TIME_SERIES`.

985 4.1.3.5 Maintaining Last Value for Data Entities

986 An *agent* **MUST** retain the most recent observation associated with each `DataItem`, even
987 if the observation is no longer in the *buffer*. This function supports the *current request*
988 functionality.

989 4.1.3.6 Unavailability of Data

990 An observation with the value of `UNAVAILABLE` indicates the value is indeterminate.

991 The *agent* **MUST** initialize every `DataItem`, unless it has a constant value (see below),
992 with an observation with the value of `UNAVAILABLE`. Additionally, whenever the data
993 source is unreachable, every `DataItem` associated with the data source must have an
994 observation with the value of `UNAVAILABLE` and `timestamp` when the connection was
995 lost.

996 An `DataItem` that is constrained to a constant value, as defined in *MTConnect Standard:
997 Part 2.0 - Device Information Model*, **MUST** only have an observation with the constant
998 value and **MUST NOT** be set to `UNAVAILABLE`.

999 4.1.3.7 Persistence and Recovery

1000 The *agent* **MAY** have a fixed size *buffer* and the *buffer* **MAY** be ephemeral.

1001 If the *buffer* is recoverable, the *agent* **MUST NOT** change the `instanceId` and **MUST**
1002 **NOT** set the *sequence number* to 1. The *sequence number* **MUST** be one greater than the
1003 maximum value of the recovered observations. $\max(\text{sequence}) + 1$

1004 **4.1.4 Storage of MTConnect Assets**

1005 An *agent* **MAY** only retain a limited number of *Assets* in the *asset buffer*. The *Assets*
 1006 are stored in first-in-first-out method where the oldest *Asset* is removed when the *asset*
 1007 *buffer* is full and a new *Asset* arrives.

1008 Figure 7 illustrates the oldest *Asset* being removed from the *asset buffer* when a new
 1009 *Asset* is added and the *asset buffer* is full:

Figure 7: First In First Out Asset Buffer Management

1010 *Assets* are indexed by *assetId*. In the case of *Assets*, Figure 8 demonstrates the
 1011 relationship between the key (*assetId*) and the stored *Asset*:

Figure 8: Relationship between *assetId* and stored *Asset* documents

1012 Note: The key (*assetId*) is independent of the order of the *Asset* stored
 1013 in the *asset buffer*.

1014 When the *agent* receives a new *Asset*, one of the following rules **MUST** apply:

- 1015 • If the *Asset* is not in the *asset buffer*, the *agent* **MUST** add the new *Asset* to the
1016 front of the *asset buffer*. If the *asset buffer* is full, the oldest *Asset* will be removed
1017 from the *asset buffer*.
- 1018 • If the *Asset* is already in the *asset buffer*, the *agent* **MUST** replace the existing
1019 *Asset* and move the *Asset* to the front of the *asset buffer*.

1020 The number of *Asset* that may be stored in an *agent* is defined by the value for *as-*
1021 *setBufferSize*. An *assetBufferSize* of 4,294,967,296 or 2^{32} **MUST** indicate
1022 unlimited storage.

1023 The *asset buffer* **MAY** be ephemeral and the *Asset* entities will be lost if the *agent* clears
1024 the *asset buffer*. They must be recovered from the data source.

1025 *MTConnect Standard: Part 4.0 - Asset Information Model* provides additional information
1026 on asset management.

1027 4.2 Response Documents

1028 *response documents* are electronic documents generated by an *agent* in response to a *re-*
1029 *quest* for data.

1030 The *response documents* defined in the *MTConnect Standard* are:

- 1031 • *MTConnectDevices Response Document*: Describes the composition and config-
1032 uration of the *Device* and the data that can be observed. See *Section 5.2 - MT-*
1033 *ConnectDevices Response Document* and *MTConnect Standard: Part 2.0 - Device*
1034 *Information Model* for details on this information model.
- 1035 • *MTConnectStreams Response Document*: *Observations* made at a point in time
1036 about related *DataItems*. See *Section 5.3 - MTConnectStreams Response Document*
1037 and *MTConnect Standard: Part 3.0 - Observation Information Model* for details on
1038 this information model.
- 1039 • *MTConnectAssets Response Document*: *Assets* related to *Devices*. See *Section 5.4 -*
1040 *MTConnectAssets Response Document* and *MTConnect Standard: Part 4.0 - Asset*
1041 *Information Model* for details on this information model.

- 1042 • *MTConnectErrors Response Document*: Information in response to a failed request.
1043 See *Section 6.1 - MTConnectErrors Response Document* for details on this informa-
1044 tion model.

1045 4.3 Request/Response Information Exchange

1046 The transfer of information between an *agent* and a client software application is based on
1047 a *request and response* REST protocol. A client application requests specific information
1048 from an *agent* and an *agent* responds with a *response document*.

1049 There are four types of *MTConnect Requests*. These *requests* are as follows:

- 1050 • *probe request*: Requests information about one more more *Devices* as an MTCon-
1051 nectDevices block.
- 1052 • *current request*: Requests the most recent, or snapshot at a *sequence number*, obser-
1053 vations as an MTConnectStreams block.
- 1054 • *sample request*: Requests a series of observations as an MTConnectStreams
1055 block.
- 1056 • *asset request*: Requests a set of assets as an MTConnectAssets block.

1057 If an *agent* is unable to respond to the request for information or the request includes
1058 invalid information, the *agent* will publish an *MTConnectErrors Response Document*. See
1059 *MTConnectErrors*.

1060 See *Section 5.1 - REST Protocol* for the details on the normative requirements of the agent.

1061 5 MTConnect Protocol

1062 The *agent* **MUST** support the *Section 5.1 - REST Protocol* and produce XML representa-
1063 tions of the information models.

1064 All other protocols and representations are optional.

1065 5.1 REST Protocol

1066 An *agent* **MUST** provide a REST API application programming interface (API) support-
1067 ing HTTP version 1.0 or greater. This interface **MUST** support HTTP (RFC7230) and use
1068 URIs (RFC3986) to identify specific information requested from an *agent*.

1069 The REST API adheres to the architectural principles of a stateless service to retrieve infor-
1070 mation associated with pieces of equipment. Additionally, the API is read-only and does
1071 not produce any side effects on the *agent* or the equipment. In REST state management,
1072 the client is responsible for recovery in case of an error or loss of connection.

1073 5.1.1 HTTP Request

1074 An *agent* **MUST** support the HTTP GET verb, all other verbs are optional. See IETF RFC
1075 7230 for a complete description of the HTTP request structure.

1076 The HTTP uses Uniform Resource Identifiers (URI) as outlined in IETF RFC 3986 as the
1077 *request-target*. IETF RFC 7230 specifies the http URI scheme for the *request-target* as
1078 follows:

- 1079 1. *protocol*: The protocol used for the request. Must be `http` or `https`.
- 1080 2. *authority*: The network domain or address of the agent with an optional port.
- 1081 3. *path*: A Hierarchical Identifier following a slash (/) and before the optional question-
1082 mark (?). The *path* separates segments by a slash (/).
- 1083 4. *query*: The portion of the HTTP request following the question-mark (?). The
1084 query portion of the HTTP request is composed of key-value pairs, = separated by
1085 an ampersand (&).

1086 **5.1.1.1 path Portion of an HTTP Request**

1087 The path portion of the *request-target* has the following segments:

- 1088 • `device-name` or `uuid`: optional name or uuid of the Device
- 1089 • `request`: request, must be one of the following: (also see *Section 5.1.4.3 - Operations for Agent*)
1090
 - 1091 – `probe`
 - 1092 – `current`
 - 1093 – `sample`
 - 1094 – `asset` or `assets`
 - 1095 * `asset` request has additional optional segment `<asset ids>`

1096 If name or uuid segment are not specified in the *HTTP Request*, an *agent* **MUST** return
1097 information for all pieces of equipment. The following sections will

1098 Examples:

- 1099 • `http://localhost:5000/my_device/probe`
1100 The request only provides information about `my_device`.
- 1101 • `http://localhost:5000/probe`
1102 The request provides information for all devices.

1103 The following section specifies the details for each request.

1104 **5.1.2 MTConnect REST API**

1105 An *agent* **MUST** support *probe requests*, *current requests*, *sample requests*, and *asset*
1106 *requests*.

1107 See the operations of the *Agent* for details regarding the *requests*.

1108 5.1.3 HTTP Errors

1109 When an *agent* receives an *HTTP Request* that is incorrectly formatted or is not supported
 1110 by the *agent*, the *agent* **MUST** publish an *HTTP Error Message* which includes a specific
 1111 status code from the tables above indicating that the *request* could not be handled by the
 1112 *agent*.

1113 Also, if the *agent* experiences an internal error and is unable to provide the requested
 1114 *response document*, it **MUST** publish an *HTTP Error Message* that includes a specific
 1115 status code from the table above.

1116 When an *agent* encounters an error in interpreting or responding to an *HTTP Request*,
 1117 the *agent* **MUST** also publish an *MConnectErrors Response Document* that provides
 1118 additional details about the error. See *Section 6 - Error Information Model* for details on
 1119 the *MConnectErrors Response Document*.

1120 5.1.3.1 Streaming Data

1121 *HTTP data streaming* is a method for an *agent* to provide a continuous stream of observa-
 1122 tions in response to a single *request* using a *publish and subscribe* communication pattern.

1123 When an *HTTP Request* includes an `interval` parameter, an *agent* **MUST** provide data
 1124 with a minimum delay in milliseconds between the end of one data transmission and the
 1125 beginning of the next. A value of zero (0) for the `interval` parameter indicates that
 1126 the *agent* should deliver data at the highest rate possible and is only relevant for *sample*
 1127 *requests* .

1128 The format of the response **MUST** use an `x-multipart-replace` encoded message
 1129 with each section separated by MIME boundaries. Each section **MUST** contain an entire
 1130 *MConnectStreams Response Document*.

1131 When streaming for a *current request*, the *agent* produces an *MConnectStreams Response*
 1132 *Document* with the most current observations every `interval` milliseconds.

1133 When streaming for a *sample request*, if there are no available observations after the `in-`
 1134 `terval` time elapsed, the *agent* **MUST** wait for either the `heartbeat` time to elapse or
 1135 an observation arrives. If the `heartbeat` time elapses and no observations arrive, then
 1136 an empty *MConnectStreams Response Document* **MUST** be sent.

1137 Note: For more information on MIME, see IETF RFC 1521 and RFC 822.

1138 An example of the format for an *HTTP Request* that includes an `interval` parameter is:

Example 1: Example for HTTP Request with interval parameter

1139 1 http://localhost:5000/sample?interval=1000

1140 HTTP Response Header:

Example 2: HTTP Response header

1141 1 HTTP/1.1 200 OK
 1142 2 Connection: close
 1143 3 Date: Sat, 13 Mar 2010 08:33:37 UTC
 1144 4 Status: 200 OK
 1145 5 Content-Disposition: inline
 1146 6 X-Runtime: 144ms
 1147 7 Content-Type: multipart/x-mixed-replace;boundary=
 1148 8 a8e12eced4fb871ac096a99bf9728425
 1149 9 Transfer-Encoding: chunked

1150 Lines 1-9 in *Example 2* represent a standard header for a MIME `multipart/x-mixed-`
 1151 `replace` message. The boundary is a separator for each section of the stream. Lines 7-8
 1152 indicate this is a multipart MIME message and the boundary between sections.

1153 With streaming protocols, the `Content-length` **MUST** be omitted and `Transfer-`
 1154 `Encoding` **MUST** be set to `chunked` (line 9). See IETF RFC 7230 for a full description
 1155 of the HTTP protocol and chunked encoding.

Example 3: HTTP Response header 2

1156 10 --a8e12eced4fb871ac096a99bf9728425
 1157 11 Content-type: text/xml
 1158 12 Content-length: 887
 1159 13
 1160 14 <?xml version="1.0" encoding="UTF-8"?>
 1161 15 <MTConnectStreams ...>...

1162 Each section of the document begins with a boundary preceded by two hyphens (-). The
 1163 `Content-type` and `Content-length` header fields **MUST** be provided for each
 1164 section and **MUST** be followed by `<CR><LF><CR><LF>` (ASCII code for `<CR>` is 13
 1165 and `<LF>` 10) before the XML document. The header and the `<CR><LF><CR><LF>`
 1166 **MUST NOT** be included in the computation of the content length.

1167 An *agent* **MUST** continue to stream results until the client closes the connection. The
 1168 *agent* **MUST NOT** stop streaming for any reason other than the following:

- 1169 • *agent* process stops
- 1170 • The client application stops receiving data

1171 5.1.3.1.1 Heartbeat

1172 When *streaming data* is requested from a *sample request*, an *agent* **MUST** support a *heart-*
 1173 *beat* to indicate to a client application that the HTTP connection is still viable during
 1174 times when there is no new data available to be published. The *heartbeat* is indicated by
 1175 an *agent* by sending an *MTConnect response document* with an empty *Streams* entity
 1176 (See *MTConnect Standard: Part 3.0 - Observation Information Model* for more details on
 1177 *Streams*) to the client software application.

1178 The *heartbeat* **MUST** occur on a periodic basis given by the optional *heartbeat* query
 1179 parameter and **MUST** default to 10 seconds. An *agent* **MUST** maintain a separate *heart-*
 1180 *beat* for each client application for which the *agent* is responding to a *data streaming*
 1181 *request*.

1182 An *agent* **MUST** begin calculating the interval for the time-period of the *heartbeat* for
 1183 each client application immediately after a *response document* is published to that specific
 1184 client application.

1185 The *heartbeat* remains in effect for each client software application until the *data stream-*
 1186 *ing request* is terminated by either the *agent* or the client application.

1187 5.1.3.2 References

1188 A *Component* **MAY** include a set of *Reference* entities of the following types that
 1189 **MAY** alter the content of the *MTConnectStreams Response Documents* published in re-
 1190 sponse to a *current request* or a *sample request* as specified:

- 1191 • A *Component* reference (*ComponentRef*) modifies the set of *Observations*, lim-
 1192 ited by a path query parameter of a *current request* or *sample request*, to include
 1193 the *Observations* associated with the entity whose value for its *id* attribute matches
 1194 the value provided for the *idRef* attribute of the *ComponentRef* element. Ad-
 1195 ditionally, *Observations* defined for any *lower level* entity(s) associated with the
 1196 identified entities **MUST** also be returned. The result is equivalent to appending
 1197 `//[@id=<"idRef">]` to the path query parameters of the *current request* or *sam-*
 1198 *ple request*. See *Section 4.1 - Agent* for more details on path queries.

- 1199 • A *DataItem* reference (*DataItemRef*) modifies the set of resulting *Observations*,
 1200 limited by a path query parameter of a *current request* or *sample request*, to include
 1201 the *Observations* whose value for its *id* attribute matches the value provided for the
 1202 *idRef* attribute of the *DataItemRef* element. The result is equivalent to append-
 1203 ing `//[@id=<"idRef">]` to the path query parameters of the *current request* or
 1204 *sample request*. See *Section 4.1 - Agent* for more details on path queries.

1205 5.1.4 Agent

1206 *agent*.

1207 An *agent* **MUST** perform the following tasks:

- 1208 • Collect data from manufacturing equipment.
- 1209 • Generate *response documents*.
- 1210 • Provide a REST interface using Hypertext Transfer Protocol (HTTP).

1211 In addition to XML and HTTP, An *agent* **MAY** provide additional protocols and represen-
 1212 tations. Some representations **MAY** have companion specifications.

1213 5.1.4.1 Value Properties of Agent

1214 *Table 3* lists the Value Properties of Agent.

Value Property name	Value Property type	Multiplicity
instanceId	uint32	1
sequenceNumber	uint64	1
bufferSize	uint32	1
maxAssets	uint32	1
assetCount	uint32	1

Table 3: Value Properties of Agent

1215 Descriptions for Value Properties of Agent:

- 1216 • instanceId
 1217 identifier for an *instance* of the *agent*.
 1218 instanceId **MUST** be changed to a different unique number each time the *buffer*
 1219 is cleared and a new set of data begins to be collected.
- 1220 • sequenceNumber
 1221 *sequence number*.

- 1222 • bufferSize
- 1223 maximum number of *Observations* that **MAY** be retained in the *agent* that published
- 1224 the *response document* at any point in time.
- 1225 • maxAssets
- 1226 maximum number of *Assets* that **MAY** be retained in the *agent* that published the
- 1227 *response document* at any point in time.
- 1228 • assetCount
- 1229 current number of *Assets* that are currently stored in the *agent* as of the creation-
- 1230 Time that the *agent* published the *response document*.

1231 **5.1.4.2 Part Properties of Agent**

1232 *Table 4* lists the Part Properties of Agent.

Part Property name	Multiplicity
Observation (organized by buffer)	0..*
Asset (organized by assetBuffer)	0..*

Table 4: Part Properties of Agent

1233 Descriptions for Part Properties of Agent:

- 1234 • Observation
- 1235 abstract entity that provides telemetry data for a `DataItem` at a point in time.
- 1236 `buffer` is a *buffer* for `Observation` types.
- 1237 • Asset
- 1238 abstract *Asset*.
- 1239 `assetBuffer` is an *asset buffer* for `Asset` types.

1240 **5.1.4.3 Operations for Agent**

- 1241 • probe
- 1242 *agent* **MUST** respond to a successful *probe request* with an `MTConnectDevices`
- 1243 entity containing either one, when a `Device` name or `uuid` is given, or all known
- 1244 `Device` entries.

1245 When successful, an `MtConnectDevices` entity is returned and status code of
 1246 200. Otherwise an `MtConnectError` and an associated status code.

1247 The parameters for `Agent` are:

1248 – `device`
 1249 if present, specifies that only the `Device` for the given name or uuid will be
 1250 returned.

1251 If not present, all associated `Device` for the `Agent` will be returned.

1252 – `status`

1253 *HTTP Status Code.*

1254 The following *HTTP Status Codes* **MUST** be supported as possible responses
 1255 to a *probe request*:

1256 * Status Code: 200, Code Name: OK:

1257 The *request* succeeded.

1258 * Status Code: 400, Code Name: Bad Request:

1259 The *request* was invalid. The *response* **MUST** have an *MtConnectErrors*
 1260 *Response Document*.

1261 * Status Code: 404, Code Name: Not Found:

1262 The device name or uuid could not be located. The *response* **MUST** have
 1263 an *MtConnectErrors Response Document*.

1264 * Status Code: 405, Code Name: Method Not Allowed:

1265 The *request* specified a method other than GET

1266 * Status Code: 406, Code Name: Not Acceptable:

1267 The HTTP Accept Header in the *request* was not one of the supported
 1268 representations.

1269 * Status Code: 431, Code Name: Request Header Fields Too
 1270 Large:

1271 The fields in the *HTTP Request* exceed the limit of the implementation of
 1272 the *agent*.

1273 * Status Code: 500, Code Name: Internal Server Error:

1274 There was an unexpected error in the *agent* while responding to a *request*.

1275 – `return`

1276 *agent* **MUST** respond to a successful *probe request* with an *HTTP Status Code*
 1277 200 (OK) and an *MtConnectDevices Response Document*. If the *request* fails,
 1278 the *agent* **MUST** respond with an *MtConnectErrors Response Document* an
 1279 *HTTP Status Code* other than 200.

1280 `MtConnectDevices` if successful, `MtConnectError` otherwise.

1281 • `current`

1282 *agent* **MUST** respond to a successful *current request* with an `MTConnectStreams`
 1283 block containing the latest values for the selected observations. If the `at` parameter
 1284 is given, the values for the observations are a snapshot taken when the `lastSe-`
 1285 `quence` number was equal to the value of the `at` parameter.

1286 When successful, an `MTConnectStreams` entity is returned and status code of
 1287 200. Otherwise an `MTConnectError` and an associated status code.

1288 The parameters for `Agent` are:

1289 - `device`

1290 optional `Device` name or `uuid`. If not given, all devices are returned.

1291 - `path`

1292 XPath evaluated against the *Device Information Model* that references the *Com-*
 1293 *ponents* and *DataItems* to include in the *MTConnectStreams Response Docu-*
 1294 *ment*.

1295 When a `Component` element is referenced by the XPath, all observations for
 1296 its *DataItems* and related *Components* **MUST** be included in the *MTConnect-*
 1297 *Streams Response Document*.

1298 - `frequency`

1299 *agent* **MUST** stream samples and events to the client application pausing for
 1300 frequency milliseconds between each part. Each part will contain a maximum
 1301 of `count` events or samples and from will be used to indicate the beginning
 1302 of the stream.

1303 **DEPRECATED** Version 1.2, replace by `interval`

1304 - `at`

1305 *response documents* **MUST** include observations consistent with a specific *se-*
 1306 *quence number* given by the value of the `at` parameter.

1307 If the value is either less than the `firstSequence` or greater than the `last-`
 1308 `Sequence`, the *request* **MUST** return a 404 *HTTP Status Code* and the *agent*
 1309 **MUST** return an *MTConnectErrors Response Document* with an `OUT_OF_RANGE`
 1310 `errorCode`.

1311 The `at` parameter **MUST NOT** be used in conjunction with the `interval`
 1312 parameter.

1313 - `interval`

1314 *agent* **MUST** continuously publish *response documents* pausing for the num-
 1315 ber of milliseconds given as the value.

1316 The `interval` value **MUST** be in milliseconds, and **MUST** be a positive
 1317 integer greater than zero (0).

1318 The `interval` parameter **MUST NOT** be used in conjunction with the `at`
 1319 parameter.

- 1320 – status
- 1321 *HTTP Status Code.*
- 1322 The following *HTTP Status Codes* **MUST** be supported as possible responses
- 1323 to a *current request*:
- 1324 * Status Code: 200, Code Name: OK:
- 1325 The *request* succeeded.
- 1326 * Status Code: 400, Code Name: Bad Request:
- 1327 The *request* was invalid. The *response* **MUST** have an *MtConnectErrors*
- 1328 *Response Document*.
- 1329 * Status Code: 404, Code Name: Not Found:
- 1330 One of the following conditions apply:
- 1331 · The device name or uuid could not be located.
- 1332 · The at was OUT_OF_RANGE range.
- 1333 The *response* **MUST** have an *MtConnectErrors Response Document*.
- 1334 * Status Code: 405, Code Name: Method Not Allowed:
- 1335 The *request* specified a method other than GET
- 1336 * Status Code: 406, Code Name: Not Acceptable:
- 1337 The HTTP Accept Header in the *request* was not one of the supported
- 1338 representations.
- 1339 * Status Code: 431, Code Name: Request Header Fields Too
- 1340 Large:
- 1341 The fields in the *HTTP Request* exceed the limit of the implementation of
- 1342 the *agent*.
- 1343 * Status Code: 500, Code Name: Internal Server Error:
- 1344 There was an unexpected error in the *agent* while responding to a *request*.
- 1345 – return
- 1346 *agent* responds to a *current request* with an *MtConnectStreams Response Doc-*
- 1347 *ument* that contains the current value of *Observations* associated with each
- 1348 piece of *streaming data* available from the *agent*, subject to any filtering de-
- 1349 fined in the *request*.
- 1350 • sample
- 1351 *agent* **MUST** respond to a successful *sample request* with an *MtConnectStreams*
- 1352 entity containing the values for the selected observations according to the parameters
- 1353 provided.
- 1354 When successful, an *MtConnectStreams* entity is returned and status code of
- 1355 200. Otherwise an *MtConnectError* and an associated status code.
- 1356 The parameters for Agent are:

- 1357 – device
 1358 optional Device name or uuid. If not given, all devices are returned.
- 1359 – path
 1360 XPath evaluated against the *Device Information Model* that references the *Components* and *DataItems* to include in the *MTCConnectStreams Response Document*.
 1361 When a Component element is referenced by the XPath, all observations for
 1362 its *DataItems* and related *Components* **MUST** be included in the *MTCConnect-*
 1363 *Streams Response Document*.
 1364 When a Component element is referenced by the XPath, all observations for
 1365 its *DataItems* and related *Components* **MUST** be included in the *MTCConnect-*
 1366 *Streams Response Document*.
- 1366 – from
 1367 designates the *sequence number* of the first observation in the *buffer* the *agent*
 1368 **MUST** consider publishing in the *response document*.
 1369 If from is zero (0), it **MUST** be set to the *firstSequence*, the oldest
 1370 observation in the *buffer*.
 1371 If from and count parameters are not given, from **MUST** default to the
 1372 *firstSequence*.
 1373 If the from parameter is less than the *firstSequence* or greater than
 1374 *lastSequence*, the *agent* **MUST** return a 404 *HTTP Status Code* and
 1375 **MUST** publish an *MTCConnectErrors Response Document* with an `OUT_OF_RANGE`
 1376 *errorCode*.
- 1377 – count
 1378 designates the maximum number of observations the *agent* **MUST** publish in
 1379 the *response document*.
 1380 The count **MUST NOT** be zero (0).
 1381 When the count is greater than zero (0), the from parameter **MUST** default
 1382 to the *firstSequence*. The evaluation of observations starts at from and
 1383 moves forward accumulating newer observations until the number of observa-
 1384 tions equals the count or the observation at *lastSequence* is considered.
 1385 When the count is less than zero (0), the from parameter **MUST** default
 1386 to the *lastSequence*. The evaluation of observations starts at from and
 1387 moves backward accumulating older observations until the number of obser-
 1388 vations equals the absolute value of count or the observation at *firstSe-*
 1389 *quence* is considered.
 1390 count **MUST NOT** be less than zero (0) when an *interval* parameter is
 1391 given.
 1392 If count is not provided, it **MUST** default to 100.
 1393 If the absolute value of count is greater than the size of the *buffer* or equal
 1394 to zero (0), the *agent* **MUST** return a 404 *HTTP Status Code* and **MUST**
 1395 publish an *MTCConnectErrors Response Document* with an `OUT_OF_RANGE`
 1396 *errorCode*.

- 1397 If the `count` parameter is not a numeric value, the *agent* **MUST** return a
 1398 400 *HTTP Status Code* and **MUST** publish an *MTConnectErrors Response*
 1399 *Document* with an `INVALID_REQUEST` `errorCode`.
- 1400 – `frequency`
 1401 *agent* **MUST** stream samples and events to the client application pausing for
 1402 `frequency` milliseconds between each part. Each part will contain a maximum
 1403 of `count` events or samples and from will be used to indicate the beginning
 1404 of the stream.
 1405 **DEPRECATED** Version 1.2, replace by `interval`
 - 1406 – `heartbeat`
 1407 sets the time period for the *heartbeat* function in an *agent*.
 1408 The value for `heartbeat` represents the amount of time after a *response doc-*
 1409 *ument* has been published until a new *response document* **MUST** be published,
 1410 even when no new data is available.
 1411 The value for `heartbeat` is defined in milliseconds.
 1412 If no value is defined for `heartbeat`, the value **MUST** default to 10 seconds.
 1413 `heartbeat` **MUST** only be specified if `interval` is also specified.
 - 1414 – `interval`
 1415 *agent* **MUST** continuously publish *response documents* when the query pa-
 1416 rameters include `interval` using the value as the minimum period between
 1417 adjacent publications.
 1418 The `interval` value **MUST** be in milliseconds, and **MUST** be a positive
 1419 integer greater than or equal to zero (0).
 1420 If the value for the `interval` parameter is zero (0), the *agent* **MUST** publish
 1421 *response documents* when any observations become available.
 1422 If the period between the publication of a *response document* and reception of
 1423 observations exceeds the `interval`, the *agent* **MUST** wait for a maximum
 1424 of `heartbeat` milliseconds for observations. Upon the arrival of observa-
 1425 tions, the *agent* **MUST** immediately publish a *response document*. When the
 1426 period equals or exceeds the `heartbeat`, the *agent* **MUST** publish an empty
 1427 *response document*.
 - 1428 – `to`
 1429 specifies the *sequence number* of the observation in the *buffer* that will be the
 1430 upper bound of the observations in the *response document*.
 1431 Rules for `to` are as follows:
 - 1432 * The value of `to` **MUST** be an unsigned 64-bit integer.
 - 1433 * The value of `to` **MUST** be greater than the `firstSequence`.
 - 1434 * The value of `to` **MUST** be less than or equal to the `lastSequence`.

- 1435 * The value of `to` **MUST** be greater than `from`.
- 1436 * If `to` and `count` are given, the `count` parameter **MUST** be greater than
1437 zero.
- 1438 * If `to` and `count` are given, the maximum number of observations pub-
1439 lished in the *response document* **MUST NOT** be greater than the value of
1440 `count`.
- 1441 * If `to` is not given, see the `from` parameter for default behavior.
- 1442 * If the `to` parameter is less than the `firstSequence` or greater than
1443 `lastSequence`, the *agent* **MUST** return a 404 *HTTP Status Code*
1444 and **MUST** publish an *MTCConnectErrors Response Document* with an
1445 `OUT_OF_RANGE` `errorCode`.
- 1446 * If the `to` parameter is not a positive numeric value, the *agent* **MUST**
1447 return a 400 *HTTP Status Code* and **MUST** publish an *MTCConnectErrors*
1448 *Response Document* with an `INVALID_REQUEST` `errorCode`.
- 1449 * If the `to` parameter is less than the `from` parameter, the *agent* **MUST**
1450 return a 400 *HTTP Status Code* and **MUST** publish an *MTCConnectErrors*
1451 *Response Document* with an `INVALID_REQUEST` `errorCode`.
- 1452 * If the `to` parameter is given and the `count` parameter is less than zero,
1453 the *agent* **MUST** return a 400 *HTTP Status Code* and **MUST** publish
1454 an *MTCConnectErrors Response Document* with an `INVALID_REQUEST`
1455 `errorCode`.
- 1456 – `status`
1457 *HTTP Status Code*.
- 1458 The following *HTTP Status Codes* **MUST** be supported as possible responses
1459 to a *current request*:
- 1460 * Status Code: 200, Code Name: OK:
1461 The *request* succeeded.
- 1462 * Status Code: 400, Code Name: Bad Request:
1463 The *request* was invalid. The *response* **MUST** have an *MTCConnectErrors*
1464 *Response Document*.
- 1465 * Status Code: 404, Code Name: Not Found:
1466 One of the following conditions apply:
1467 · The device name or UUID could not be located.
1468 · One of the `asset_ids` could not be found.
1469 The *response* **MUST** have an *MTCConnectErrors Response Document*.
- 1470 * Status Code: 405, Code Name: Method Not Allowed:
1471 The *request* specified a method other than GET
- 1472 * Status Code: 406, Code Name: Not Acceptable:
1473 The HTTP Accept Header in the *request* was not one of the supported
1474 representations.

- 1475 * Status Code: 431, Code Name: Request Header Fields Too
 1476 Large:
 1477 The fields in the *HTTP Request* exceed the limit of the implementation of
 1478 the *agent*.
- 1479 * Status Code: 500, Code Name: Internal Server Error:
 1480 There was an unexpected error in the *agent* while responding to a *request*.
- 1481 - return
 1482 *agent* **MUST** respond to a successful *sample request* with an *HTTP Status*
 1483 *Code* 200 (OK) and an *MTCConnectStreams Response Document*. If the *request*
 1484 fails, the *agent* **MUST** respond with an *MTCConnectErrors Response Document*
 1485 an *HTTP Status Code* other than 200.
- 1486 • asset
 1487 *agent* **MUST** respond to a successful *asset request* with an *MTCConnectAssets*
 1488 entity with the selected asset entities according to the parameters provided.
- 1489 When successful, an *MTCConnectAssets* entity is returned and status code of 200.
 1490 Otherwise an *MTCConnectError* and an associated status code.
- 1491 The parameters for Agent are:
- 1492 - device
 1493 optional Device name or uuid. If not given, all devices are returned.
- 1494 - assetIds
 1495 path portion is a list of (asset_id) for specific *MTCConnectAssets Response*
 1496 *Documents*.
- 1497 In response, the *agent* returns an *MTCConnectAssets Response Document* that
 1498 contains information for the specific assets for each of the *asset_id* values
 1499 provided in the *request*. Each *asset_id* is separated by a “;”.
- 1500 - count
 1501 specifies the maximum number of *MTCConnectAssets Response Documents* re-
 1502 turned in an *MTCConnectAssets Response Document*.
 1503 If *count* is not given, the default value **MUST** be 100.
- 1504 - type
 1505 type of *Asset*. See *MTCConnect Standard: Part 4.0 - Asset Information Model*.
- 1506 - removed
 1507 value for *removed* **MUST** be *true* or *false* and interpreted as follows:
- 1508 * *true*: *MTCConnectAssets Response Documents* for assets marked as re-
 1509 moved **MUST** be included in the *response document*.

1510 * false: *MTConnectAssets Response Documents* for assets marked as re-
 1511 removed **MUST NOT** be included in the *response document*.

1512 If removed is not given, the default value **MUST** be false.

1513 – status

1514 *HTTP Status Code*.

1515 The following *HTTP Status Codes* **MUST** be supported as possible responses
 1516 to a *asset request*:

1517 * Status Code: 200, Code Name: OK:
 1518 The *request* succeeded.

1519 * Status Code: 400, Code Name: Bad Request:
 1520 The *request* was invalid. The *response* **MUST** have an *MTConnectErrors*
 1521 *Response Document*.

1522 * Status Code: 404, Code Name: Not Found:
 1523 One of the following conditions apply:

1524 · The device name or uuid could not be located.

1525 · The from or to was OUT_OF_RANGE.

1526 The *response* **MUST** have an *MTConnectErrors Response Document*.

1527 * Status Code: 405, Code Name: Method Not Allowed:
 1528 The *request* specified a method other than GET

1529 * Status Code: 406, Code Name: Not Acceptable:
 1530 The HTTP Accept Header in the *request* was not one of the supported
 1531 representations.

1532 * Status Code: 431, Code Name: Request Header Fields Too
 1533 Large:
 1534 The fields in the *HTTP Request* exceed the limit of the implementation of
 1535 the *agent*.

1536 * Status Code: 500, Code Name: Internal Server Error:
 1537 There was an unexpected error in the *agent* while responding to a *request*.

1538 – return

1539 *MTConnectAssets Response Documents* provided in the *MTConnectAssets Re-*
 1540 *sponse Document* will be limited to those specified in the combination of the
 1541 path segment of the *asset request* and the parameters provided in the query
 1542 segment of that *request*.

1543 5.2 MTConnectDevices Response Document

1544 This section provides semantic information for the `MTConnectDevices` entity.

1545 **5.2.1 MTConnectDevices**

1546 root entity of an *MTConnectDevices Response Document* that contains the *Device Information Model* of one or more Device entities.

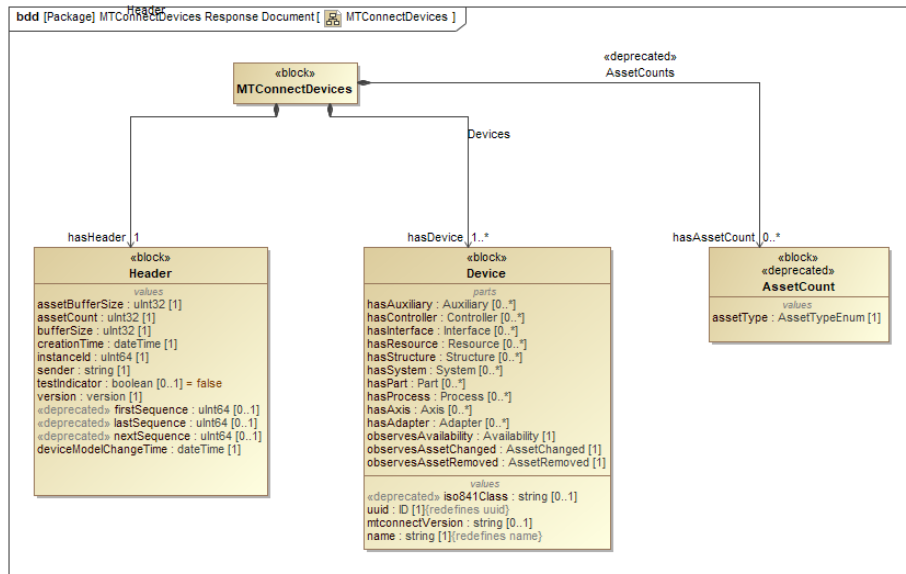

Figure 9: MTConnectDevices

1548 Note: Additional properties of MTConnectDevices **MAY** be defined for
 1549 schema and namespace declaration. See *Section C - Schema and Namespace*
 1550 *Declaration Information* for an XML example.

1551 **5.2.1.1 Part Properties of MTConnectDevices**

1552 *Table 5* lists the Part Properties of MTConnectDevices.

Part Property name	Multiplicity
Header	1
Device (organized by Devices)	1..*

Table 5: Part Properties of MTConnectDevices

1553 Descriptions for Part Properties of MTConnectDevices:

- 1554 • Header

1555 provides information from an *agent* defining version information, storage capacity,
 1556 and parameters associated with the data management within the *agent*.

1557 • Device

1558 Component composed of a piece of equipment that produces observations about
 1559 itself.

1560 *Devices* groups one or more *Device* entities. See *MTCConnect Standard: Part*
 1561 *2.0 - Device Information Model* for more detail.

1562 **5.2.2 Header**

1563 provides information from an *agent* defining version information, storage capacity, and
 1564 parameters associated with the data management within the *agent*.

1565 **5.2.2.1 Value Properties of Header**

1566 *Table 6* lists the Value Properties of Header.

Value Property name	Value Property type	Multiplicity
assetBufferSize	uint32	1
assetCount	uint32	1
bufferSize	uint32	1
creationTime	datetime	1
instanceId	uint64	1
sender	string	1
testIndicator	boolean	0..1
version	version	1
<<deprecated>> firstSequence	uint64	0..1
<<deprecated>> lastSequence	uint64	0..1
<<deprecated>> nextSequence	uint64	0..1
deviceModelChangeTime	datetime	1

Table 6: Value Properties of Header

1567 Descriptions for Value Properties of Header:

1568 • assetBufferSize

1569 maximum number of *Asset* types that can be stored in the *agent* that published the
 1570 *response document*.

- 1571 Note: The implementer is responsible for allocating the appropriate amount
1572 of storage capacity required to accommodate the `assetBufferSize`.
- 1573 • `assetCount`
1574 current number of *Asset* that are currently stored in the *agent* as of the *cre-*
1575 *ationTime* that the *agent* published the *response document*.
1576 `assetCount` **MUST NOT** be larger than the value reported for `assetBuffer-`
1577 `Size`.
 - 1578 • `bufferSize`
1579 maximum number of *DataItems* that **MAY** be retained in the *agent* that published
1580 the *response document* at any point in time.

1581 Note 1 to entry: `bufferSize` represents the maximum number of se-
1582 quence numbers that **MAY** be stored in the *agent*.

1583 Note 2 to entry: The implementer is responsible for allocating the appro-
1584 priate amount of storage capacity required to accommodate the `buffer-`
1585 `Size`.
 - 1586 • `creationTime`
1587 timestamp that an *agent* published the *response document*.
 - 1588 • `instanceId`
1589 identifier for a specific instantiation of the *buffer* associated with the *agent* that pub-
1590 lished the *response document*.
1591 `instanceId` **MUST** be changed to a different unique number each time the *buffer*
1592 is cleared and a new set of data begins to be collected.
 - 1593 • `sender`
1594 identification defining where the *agent* that published the *response document* is in-
1595 stalled or hosted.
1596 `sender` **MUST** be either an IP Address or Hostname describing where the *agent*
1597 is installed or the URL of the *agent*; e.g., `http://<address>[:port]/`.

1598 Note: The port number need not be specified if it is the default HTTP
1599 port 80.
 - 1600 • `testIndicator`
1601 indicates whether the *agent* that published the *response document* is operating in a
1602 test mode.

1603 If `testIndicator` is not specified, the value for `testIndicator` **MUST** be
1604 interpreted to be `false`.

1605 • `version`

1606 *major*, *minor*, and *revision* number of the MTConnect Standard that defines the
1607 *semantic data model* that represents the content of the *response document*. It also
1608 includes the revision number of the *schema* associated with that specific *semantic*
1609 *data model*.

1610 As an example, the value reported for `version` for a *response document* that was
1611 structured based on *schema* revision 10 associated with Version 1.4.0 of the MT-
1612 Connect Standard would be: 1.4.0.10

1613 • `<<deprecated>> firstSequence`

1614 *sequence number* assigned to the oldest piece of *streaming data* stored in the *buffer*
1615 of the *agent* immediately prior to the time that the *agent* published the *response*
1616 *document*.

1617 • `<<deprecated>> lastSequence`

1618 *sequence number* assigned to the last piece of *streaming data* that was added to
1619 the *buffer* of the *agent* immediately prior to the time that the *agent* published the
1620 *response document*.

1621 • `<<deprecated>> nextSequence`

1622 *sequence number* of the piece of *streaming data* that is the next piece of data to be
1623 retrieved from the *buffer* of the *agent* that was not included in the *response document*
1624 published by the *agent*.

1625 If the *streaming data* included in the *response document* includes the last piece of
1626 data stored in the *buffer* of the *agent* at the time that the document was published,
1627 then the value reported for `nextSequence` **MUST** be equal to `lastSequence`
1628 + 1.

1629 • `deviceModelChangeTime`

1630 timestamp of the last update of the `Device` information for any device.

1631 5.2.2.2 Part Properties of Header

1632 *Table 7* lists the Part Properties of Header.

Part Property name	Multiplicity
<<deprecated>> AssetCount (organized by <<deprecated>> AssetCounts)	0..*

Table 7: Part Properties of Header

1633 Descriptions for Part Properties of Header:

- 1634 • <<deprecated>> AssetCount
- 1635 count of each asset type currently in the *agent*.
- 1636 AssetCounts groups AssetCount entities.

1637 5.2.3 <<deprecated>>AssetCount

1638 count of each asset type currently in the *agent*.

1639 5.2.3.1 Value Properties of AssetCount

1640 *Table 8* lists the Value Properties of AssetCount.

Value Property name	Value Property type	Multiplicity
assetType	string	1

Table 8: Value Properties of AssetCount

1641 Descriptions for Value Properties of AssetCount:

- 1642 • assetType
- 1643 type of *Asset*.

1644 5.3 MTConnectStreams Response Document

1645 This section provides semantic information for the MTConnectStreams entity.

1646 **5.3.1 MTConnectStreams**

1647 root entity of an *MTConnectStreams Response Document* that contains the *Observation*
 1648 *Information Model* of one or more *Device* entities.

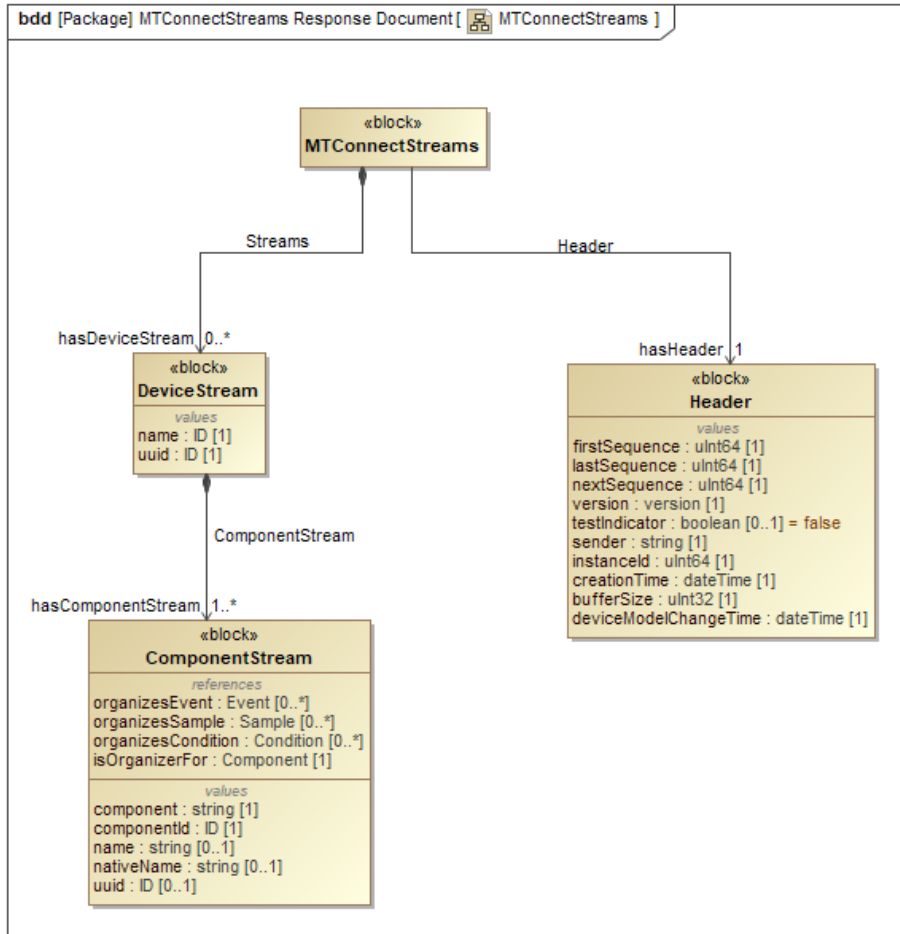

Figure 10: MTConnectStreams

1649 Note: Additional properties of `MTConnectStreams` **MAY** be defined for
 1650 schema and namespace declaration. See *Section C - Schema and Namespace*
 1651 *Declaration Information* for an XML example.

1652 **5.3.1.1 Part Properties of MTConnectStreams**

1653 *Table 9* lists the Part Properties of `MTConnectStreams`.

Part Property name	Multiplicity
Header	1
DeviceStream (organized by Streams)	0..*

Table 9: Part Properties of MTConnectStreams

1654 Descriptions for Part Properties of MTConnectStreams:

- 1655 • Header
- 1656 provides information from an *agent* defining version information, storage capacity,
- 1657 and parameters associated with the data management within the *agent*.
- 1658 • DeviceStream
- 1659 *organizes* data reported from a Device.
- 1660 Streams groups one or more DeviceStream entities. See *MTConnect Stan-*
- 1661 *dard: Part 3.0 - Observation Information Model* for more detail.

1662 5.3.2 Header

1663 provides information from an *agent* defining version information, storage capacity, and
 1664 parameters associated with the data management within the *agent*.

1665 5.3.2.1 Value Properties of Header

1666 *Table 10* lists the Value Properties of Header.

Value Property name	Value Property type	Multiplicity
firstSequence	uint64	1
lastSequence	uint64	1
nextSequence	uint64	1
version	version	1
testIndicator	boolean	0..1
sender	string	1
instanceId	uint64	1
creationTime	datetime	1
bufferSize	uint32	1
deviceModelChangeTime	datetime	1

Table 10: Value Properties of Header

1667 Descriptions for Value Properties of Header:

1668 • firstSequence

1669 *sequence number* assigned to the oldest piece of *streaming data* stored in the *buffer*
 1670 of the *agent* immediately prior to the time that the *agent* published the *response*
 1671 *document*.

1672 • lastSequence

1673 *sequence number* assigned to the last piece of *streaming data* that was added to
 1674 the *buffer* of the *agent* immediately prior to the time that the *agent* published the
 1675 *response document*.

1676 • nextSequence

1677 *sequence number* of the piece of *streaming data* that is the next piece of data to be
 1678 retrieved from the *buffer* of the *agent* that was not included in the *response document*
 1679 published by the *agent*.

1680 If the *streaming data* included in the *response document* includes the last piece of
 1681 data stored in the *buffer* of the *agent* at the time that the document was published,
 1682 then the value reported for *nextSequence* **MUST** be equal to *lastSequence*
 1683 + 1.

1684 • version

1685 *major*, *minor*, and *revision* number of the MTConnect Standard that defines the
 1686 *semantic data model* that represents the content of the *response document*. It also
 1687 includes the revision number of the *schema* associated with that specific *semantic*
 1688 *data model*.

1689 As an example, the value reported for `version` for a *response document* that was
 1690 structured based on *schema* revision 10 associated with Version 1.4.0 of the MT-
 1691 Connect Standard would be: 1.4.0.10

- 1692 • `testIndicator`

1693 indicates whether the *agent* that published the *response document* is operating in a
 1694 test mode.

1695 If `testIndicator` is not specified, the value for `testIndicator` **MUST** be
 1696 interpreted to be `false`.

- 1697 • `sender`

1698 identification defining where the *agent* that published the *response document* is in-
 1699 stalled or hosted.

1700 `sender` **MUST** be either an IP Address or Hostname describing where the *agent*
 1701 is installed or the URL of the *agent*; e.g., `http://<address>[:port]/`.

1702 Note: The port number need not be specified if it is the default HTTP
 1703 port 80.

- 1704 • `instanceId`

1705 identifier for a specific instantiation of the *buffer* associated with the *agent* that pub-
 1706 lished the *response document*.

1707 `instanceId` **MUST** be changed to a different unique number each time the *buffer*
 1708 is cleared and a new set of data begins to be collected.

- 1709 • `creationTime`

1710 timestamp that an *agent* published the *response document*.

- 1711 • `bufferSize`

1712 maximum number of *DataItems* that **MAY** be retained in the *agent* that published
 1713 the *response document* at any point in time.

1714 Note 1 to entry: `bufferSize` represents the maximum number of se-
 1715 quence numbers that **MAY** be stored in the *agent*.

1716 Note 2 to entry: The implementer is responsible for allocating the appro-
 1717 priate amount of storage capacity required to accommodate the `buffer-`
 1718 `Size`.

- 1719 • `deviceModelChangeTime`

1720 timestamp of the last update of the *Device* information for any device.

1721 5.4 MTConnectAssets Response Document

1722 This section provides semantic information for the `MTConnectAssets` entity.

1723 5.4.1 MTConnectAssets

1724 root entity of an *MTConnectAssets Response Document* that contains the *Asset Information*

1725 *Model* of *Asset* types.

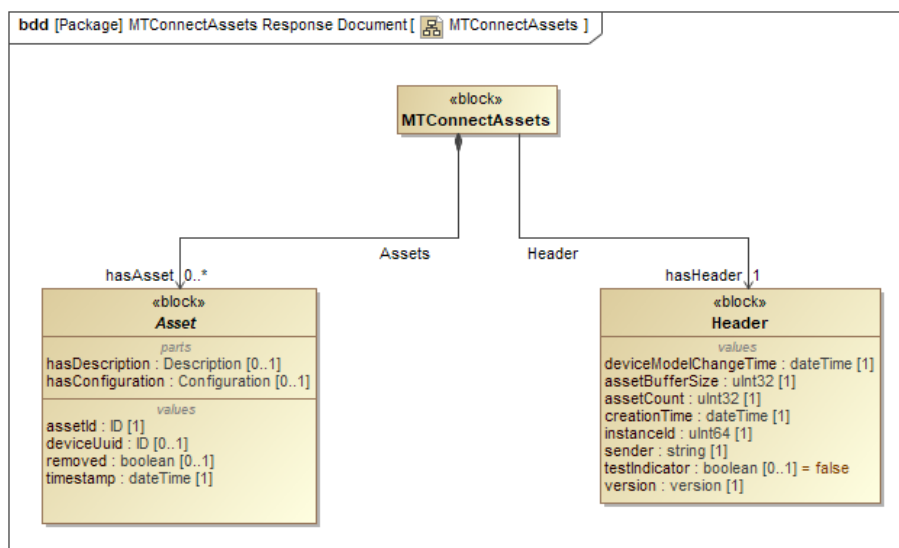

Figure 11: MTConnectAssets

1726 Note: Additional properties of `MTConnectAssets` **MAY** be defined for
 1727 schema and namespace declaration. See *Section C - Schema and Namespace*
 1728 *Declaration Information* for an XML example.

1729 5.4.1.1 Part Properties of MTConnectAssets

1730 *Table 11* lists the Part Properties of `MTConnectAssets`.

Part Property name	Multiplicity
Header	1
Asset (organized by Assets)	0..*

Table 11: Part Properties of MTConnectAssets

1731 Descriptions for Part Properties of MTConnectAssets:

1732 • Header

1733 provides information from an *agent* defining version information, storage capacity,
1734 and parameters associated with the data management within the *agent*.

1735 • Asset

1736 abstract *Asset*.

1737 *Assets* groups one or more *Asset* types. See *MTConnect Standard: Part 4.0 -*
1738 *Asset Information Model* for more details.

1739 5.4.2 Header

1740 provides information from an *agent* defining version information, storage capacity, and
1741 parameters associated with the data management within the *agent*.

1742 5.4.2.1 Value Properties of Header

1743 *Table 12* lists the Value Properties of Header.

Value Property name	Value Property type	Multiplicity
deviceModelChangeTime	datetime	1
assetBufferSize	uint32	1
assetCount	uint32	1
creationTime	datetime	1
instanceId	uint64	1
sender	string	1
testIndicator	boolean	0..1
version	version	1

Table 12: Value Properties of Header

1744 Descriptions for Value Properties of Header:

- 1745 • `deviceModelChangeTime`
 1746 timestamp of the last update of the `Device` information for any device.
- 1747 • `assetBufferSize`
 1748 maximum number of `Asset` types that can be stored in the *agent* that published the
 1749 *response document*.
- 1750 Note: The implementer is responsible for allocating the appropriate amount
 1751 of storage capacity required to accommodate the `assetBufferSize`.
- 1752 • `assetCount`
 1753 current number of `Asset` that are currently stored in the *agent* as of the `cre-`
 1754 `ationTime` that the *agent* published the *response document*.
 1755 `assetCount` **MUST NOT** be larger than the value reported for `assetBuffer-`
 1756 `Size`.
- 1757 • `creationTime`
 1758 timestamp that an *agent* published the *response document*.
- 1759 • `instanceId`
 1760 identifier for a specific instantiation of the *buffer* associated with the *agent* that pub-
 1761 lished the *response document*.
 1762 `instanceId` **MUST** be changed to a different unique number each time the *buffer*
 1763 is cleared and a new set of data begins to be collected.
- 1764 • `sender`
 1765 identification defining where the *agent* that published the *response document* is in-
 1766 stalled or hosted.
 1767 `sender` **MUST** be either an IP Address or Hostname describing where the *agent*
 1768 is installed or the URL of the *agent*; e.g., `http://<address>[:port]/`.
- 1769 Note: The port number need not be specified if it is the default HTTP
 1770 port 80.
- 1771 • `testIndicator`
 1772 indicates whether the *agent* that published the *response document* is operating in a
 1773 test mode.
 1774 If `testIndicator` is not specified, the value for `testIndicator` **MUST** be
 1775 interpreted to be `false`.

- 1776 • `version`
- 1777 *major*, *minor*, and *revision* number of the MTConnect Standard that defines the
- 1778 *semantic data model* that represents the content of the *response document*. It also
- 1779 includes the revision number of the *schema* associated with that specific *semantic*
- 1780 *data model*.
- 1781 As an example, the value reported for `version` for a *response document* that was
- 1782 structured based on *schema* revision 10 associated with Version 1.4.0 of the MT-
- 1783 Connect Standard would be: 1.4.0.10

1784 6 Error Information Model

1785 The *Error Information Model* establishes the rules and terminology that describes the *response document* returned by an *agent* when it encounters an error while interpreting a
 1786 *request* for information from a client software application or when an *agent* experiences
 1787 an error while publishing the *response* to a *request* for information.
 1788

1789 An *agent* provides the information regarding errors encountered when processing a *request*
 1790 for information by publishing an *MTConnectErrors Response Document* to the client soft-
 1791 ware application that made the *request* for information.

1792 6.1 MTConnectErrors Response Document

1793 This section provides semantic information for the `MTConnectErrors` entity.

1794 6.1.1 MTConnectError

1795 root entity of an *MTConnectErrors Response Document* that contains the *Error Informa-*
 1796 *tion Model*.

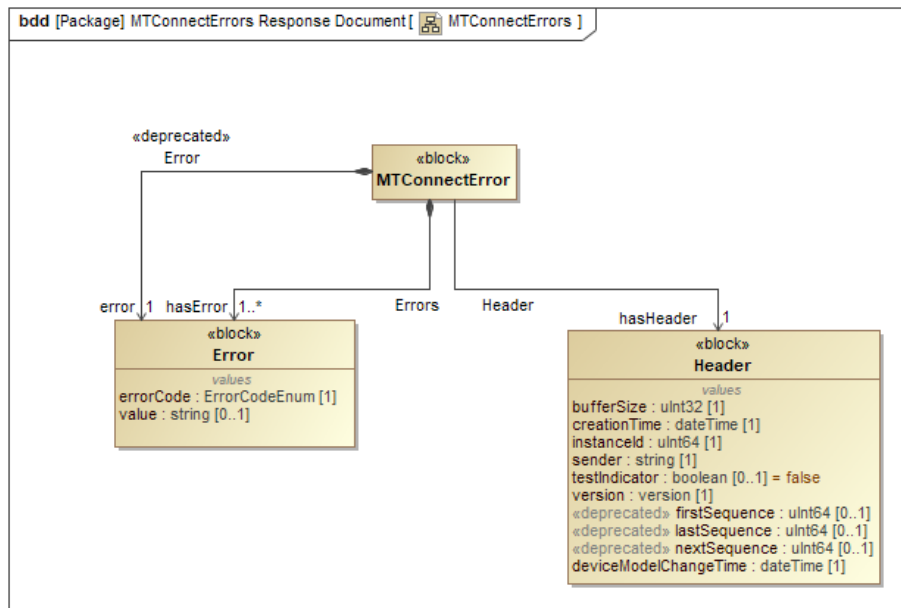

Figure 12: MTConnectError

1797 Note: Additional properties of `MTConnectError` **MAY** be defined for schema
 1798 and namespace declaration. See *Section C - Schema and Namespace Decla-*
 1799 *ration Information* for an XML example.

1800 6.1.1.1 Part Properties of `MTConnectError`

1801 *Table 13* lists the Part Properties of `MTConnectError`.

Part Property name	Multiplicity
Header	1
Error (organized by Errors)	1..*
<<deprecated>> Error	1

Table 13: Part Properties of `MTConnectError`

1802 Descriptions for Part Properties of `MTConnectError`:

1803 • Header
 1804 provides information from an *agent* defining version information, storage capacity,
 1805 and parameters associated with the data management within the *agent*.

1806 • Error
 1807 error encountered by an *agent* when responding to a *request*.
 1808 `Errors` groups one or more `Error` entities. See *Section 6.1.3 - Error*.

1809 Note: When compatibility with Version 1.0.1 and earlier of the `MTCon-`
 1810 `nect Standard` is required for an implementation, the *MTConnectErrors*
 1811 *Response Document* contains only a single `Error` entity and the `Er-`
 1812 `rors` entity **MUST NOT** appear in the document.

1813 • Error
 1814 error encountered by an *agent* when responding to a *request*.

1815 6.1.2 Header

1816 provides information from an *agent* defining version information, storage capacity, and
 1817 parameters associated with the data management within the *agent*.

1818 **6.1.2.1 Value Properties of Header**1819 *Table 14* lists the Value Properties of Header.

Value Property name	Value Property type	Multiplicity
bufferSize	uint32	1
creationTime	datetime	1
instanceId	uint64	1
sender	string	1
testIndicator	boolean	0..1
version	version	1
<<deprecated>> firstSequence	uint64	0..1
<<deprecated>> lastSequence	uint64	0..1
<<deprecated>> nextSequence	uint64	0..1
deviceModelChangeTime	datetime	1

Table 14: Value Properties of Header

1820 Descriptions for Value Properties of Header:

- 1821 • bufferSize
- 1822 maximum number of *DataItems* that **MAY** be retained in the *agent* that published
- 1823 the *response document* at any point in time.

1824 Note 1 to entry: bufferSize represents the maximum number of se-

1825 quence numbers that **MAY** be stored in the *agent*.

1826 Note 2 to entry: The implementer is responsible for allocating the appro-

1827 priate amount of storage capacity required to accommodate the buffer-

1828 Size.

- 1829 • creationTime
- 1830 timestamp that an *agent* published the *response document*.

- 1831 • instanceId
- 1832 identifier for a specific instantiation of the *buffer* associated with the *agent* that pub-
- 1833 lished the *response document*.

1834 instanceId **MUST** be changed to a different unique number each time the *buffer*

1835 is cleared and a new set of data begins to be collected.

- 1836 • sender
 1837 identification defining where the *agent* that published the *response document* is in-
 1838 stalled or hosted.
- 1839 sender **MUST** be either an IP Address or Hostname describing where the *agent*
 1840 is installed or the URL of the *agent*; e.g., `http://<address>[:port]/`.
- 1841 Note: The port number need not be specified if it is the default HTTP
 1842 port 80.
- 1843 • testIndicator
 1844 indicates whether the *agent* that published the *response document* is operating in a
 1845 test mode.
- 1846 If testIndicator is not specified, the value for testIndicator **MUST** be
 1847 interpreted to be false.
- 1848 • version
 1849 *major*, *minor*, and *revision* number of the MTConnect Standard that defines the
 1850 *semantic data model* that represents the content of the *response document*. It also
 1851 includes the revision number of the *schema* associated with that specific *semantic*
 1852 *data model*.
- 1853 As an example, the value reported for version for a *response document* that was
 1854 structured based on *schema* revision 10 associated with Version 1.4.0 of the MT-
 1855 Connect Standard would be: 1.4.0.10
- 1856 • <<deprecated>> firstSequence
 1857 *sequence number* assigned to the oldest piece of *streaming data* stored in the *buffer*
 1858 of the *agent* immediately prior to the time that the *agent* published the *response*
 1859 *document*.
- 1860 • <<deprecated>> lastSequence
 1861 *sequence number* assigned to the last piece of *streaming data* that was added to
 1862 the *buffer* of the *agent* immediately prior to the time that the *agent* published the
 1863 *response document*.
- 1864 • <<deprecated>> nextSequence
 1865 *sequence number* of the piece of *streaming data* that is the next piece of data to be
 1866 retrieved from the *buffer* of the *agent* that was not included in the *response document*
 1867 published by the *agent*.
- 1868 If the *streaming data* included in the *response document* includes the last piece of
 1869 data stored in the *buffer* of the *agent* at the time that the document was published,

1870 then the value reported for `nextSequence` **MUST** be equal to `lastSequence`
 1871 + 1.

1872 • `deviceModelChangeTime`
 1873 timestamp of the last update of the `Device` information for any device.

1874 6.1.3 Error

1875 error encountered by an *agent* when responding to a *request*.

1876 The value of `Error` **MUST** be `string`.

1877 6.1.3.1 Value Properties of Error

1878 *Table 15* lists the Value Properties of `Error`.

Value Property name	Value Property type	Multiplicity
<code>errorCode</code>	<code>ErrorCodeEnum</code>	1

Table 15: Value Properties of Error

1879 Descriptions for Value Properties of `Error`:

1880 • `errorCode`
 1881 descriptive code that indicates the type of error that was encountered by an *agent*.
 1882 `ErrorCodeEnum` Enumeration:

- 1883 – `ASSET_NOT_FOUND`
 1884 *request* for information specifies an `Asset` that is not recognized by the *agent*.
- 1885 – `INTERNAL_ERROR`
 1886 *agent* experienced an error while attempting to published the requested infor-
 1887 mation.
- 1888 – `INVALID_REQUEST`
 1889 *request* contains information that was not recognized by the *agent*.
- 1890 – `INVALID_URI`
 1891 Uniform Resource Identifier (URI) provided was incorrect.

- 1892 – INVALID_XPATH
1893 XML Path Language (XPath) identified in the *request* for information could
1894 not be parsed correctly by the *agent*.
1895 This could be caused by an invalid syntax or the XPath did not match a valid
1896 identify for any information stored in the *agent*.
- 1897 – NO_DEVICE
1898 identity of the *Device* specified in the *request* for information is not associ-
1899 ated with the *agent*.
- 1900 – OUT_OF_RANGE
1901 *request* for information specifies *streaming data* that includes sequence num-
1902 ber(s) for pieces of data that are beyond the end of the *buffer*.
- 1903 – QUERY_ERROR
1904 *agent* was unable to interpret the query.
1905 The query parameters do not contain valid values or include an invalid param-
1906 eter.
- 1907 – TOO_MANY
1908 *count* parameter provided in the *request* for information requires either of the
1909 following:
1910 * *streaming data* that includes more pieces of data than the *agent* is capable
1911 of organizing in an *MTCConnectStreams Response Document*.
1912 * *Assets* that include more *Asset* in an *MTCConnectAssets Response Doc-*
1913 *ument* than the *agent* is capable of handling.
- 1914 – UNAUTHORIZED
1915 *requester* does not have sufficient permissions to access the requested informa-
1916 tion.
- 1917 – UNSUPPORTED
1918 valid *request* was provided, but the *agent* does not support the feature or type
1919 of *request*.

1920 7 Profile

1921 MTConnect Profile is a *profile* that extends the Systems Modeling Language (SysML)
1922 metamodel for the MTConnect domain using additional data types and *stereotypes*.

1923 7.1 DataTypes

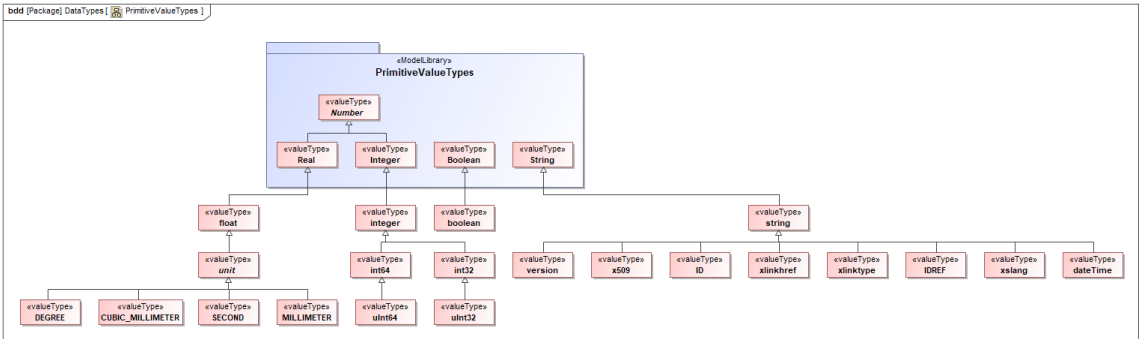

Figure 13: DataTypes

1924 7.1.1 boolean

1925 primitive type.

1926 7.1.2 ID

1927 string that represents an identifier (ID).

1928 7.1.3 string

1929 primitive type.

1930 7.1.4 float

1931 primitive type.

1932 7.1.5 datetime

1933 string that represents timestamp in ISO 8601 format.

1934 7.1.6 integer

1935 primitive type.

1936 7.1.7 xlinktype

1937 string that represents the type of an XLink element. See <https://www.w3.org/TR/xlink11/>.

1939 7.1.8 xslang

1940 string that represents a language tag. See <http://www.ietf.org/rfc/rfc4646.txt>.

1942 7.1.9 SECOND

1943 float that represents time in seconds.

1944 7.1.10 IDREF

1945 string that represents a reference to an ID.

1946 7.1.11 xlinkhref

1947 string that represents the locator attribute of an XLink element. See <https://www.w3.org/TR/xlink11/>.

1949 7.1.12 x509

1950 string that represents an x509 data block. *Ref ISO/IEC 9594-8:2020.*

1951 7.1.13 int32

1952 32-bit integer.

1953 7.1.14 int64

1954 64-bit integer.

1955 7.1.15 version

1956 series of four numeric values, separated by a decimal point, representing a *major*, *minor*,
1957 and *revision* number of the MTConnect Standard and the revision number of a specific
1958 *schema*.

1959 7.1.16 uint32

1960 32-bit unsigned integer.

1961 7.1.17 uint64

1962 64-bit unsigned integer.

1963 7.1.18 binary

1964 base-2 numeral system or binary numeral system represented by two digits: “0” and “1”.

1965 7.1.19 double

1966 primitive type.

1967 7.2 Stereotypes

1968 7.2.1 organizer

1969 element that *organizes* other elements of a type.

1970 7.2.2 deprecated

1971 element that has been deprecated.

1972 7.2.3 extensible

1973 enumeration that can be extended.

1974 7.2.4 informative

1975 element that is descriptive and non-normative.

1976 7.2.5 valueType

1977 extends SysML <<ValueType>> to include `Class` as a value type.

1978 7.2.6 normative

1979 element that has been added to the standard.

1980 **7.2.7 observes**

1981 association in which a *Component* makes *Observations* about an observable *DataItem*.

Figure 14: Stereotypes

2033 B Fundamentals of Using XML to Encode Response Documents

2034 The MTConnect Standard specifies the structures and constructs that are used to encode
 2035 *response documents*. When these *response documents* are encoded using XML, there are
 2036 additional rules defined by the XML standard that apply for creating an XML compliant
 2037 document. An implementer should refer to the W3C website for additional information on
 2038 XML documentation and implementation details - <http://www.w3.org/XML>.

2039 The following provides specific terms and guidelines referenced in the MTConnect Stan-
 2040 dard for forming *response documents* with XML:

2041 • **tag**: A tag is an XML construct that forms the foundation for an XML expression.
 2042 It defines the scope (beginning and end) of an XML expression. The main types of
 2043 tags are:

2044 • **start-tag**: Designates the beginning on an XML element; e.g., *<element name>*

2045 • **end-tag**: Designates the end on an XML element; e.g., *</element name>*.

2046 Note: If an element has no *child elements* or Character Data (CDATA), the
 2047 end-tag may be shortened to */>*.

2048 • **Element**: An element is an XML statement that is the primary building block
 2049 for a document encoded using XML. An element begins with a *start-tag* and
 2050 ends with a matching *end-tag*. The characters between the *start-tag* and the
 2051 *end-tag* are the element's content. The content may contain attributes, CDATA,
 2052 and/or other elements. If the content contains additional elements, these elements
 2053 are called *child elements*.

2054 An example would be: *<element name>*Content of the Element*</element name>*.

2055 • **child element**: An XML element that is contained within a higher-level *parent ele-*
 2056 *ment*. A *child element* is also known as a sub-element. XML allows an unlimited
 2057 hierarchy of *parent element-child element* relationships that establishes the struc-
 2058 ture that defines how the various pieces of information in the document relate to
 2059 each other. A *parent element* may have multiple associated *child elements*.

2060 • **element name**: A descriptive identifier contained in both the *start-tag* and *end-*
 2061 *tag* that provides the name of an XML element.

- 2062 • **Attribute:** A construct consisting of a name–value pair that provides additional
 2063 information about that XML element. The format for an attribute is ‘name=’value’;
 2064 where the value for the attribute is enclosed in a set of quotation (“) marks. An XML
 2065 attribute **MUST** only have a single value and each attribute can appear at most once
 2066 in each element. Also, each attribute **MUST** be defined in a *schema* to either be
 2067 required or optional.
- 2068 • An example of attributes for an XML element is *Example 4*:

Example 4: Example of attributes for an element

```
2069 1 <DataItem category="SAMPLE" id="S1load"
2070 2   nativeUnits="PERCENT" type="LOAD"
2071 3   units="PERCENT"/>
```

2072 In this example, `DataItem` is the *element name*. `category`, `id`, `nativeUnits`,
 2073 `type`, and `units` are the names of the attributes. “SAMPLE”, “S1load”, “PERCENT”,
 2074 “LOAD”, and “PERCENT” are the values for each of the respective attributes.

- 2075 • **CDATA:** CDATA is an XML term representing *Character Data*. *Character Data*
 2076 contains a value(s) or text that is associated with an XML element. CDATA can be
 2077 restricted to certain formats, patterns, or words.

2078 An example of CDATA associated with an XML element would be *Example 5*:

Example 5: Example of cdata associated with element

```
2079 1 <Message id="M1">This is some text</Message>
```

2080 In this example, `Message` is the *element name* and `This is some text` is the CDATA.

- 2081 • **namespace:** An XML *namespace* defines a unique vocabulary for named elements
 2082 and attributes in an XML document. An XML document may contain content that is
 2083 associated with multiple *namespaces*. Each *namespace* has its own unique identifier.

2084 Elements and attributes are associated with a specific *namespace* by placing a prefix on
 2085 the name of the element or attribute that associates that name to a specific *namespace*; e.g.,
 2086 `x:MyTarget` associates the element name `MyTarget` with the *namespace* designated
 2087 by `x`: (the prefix).

2088 *namespaces* are used to avoid naming conflicts within an XML document. The nam-
 2089 ing convention used for elements and attributes may be associated with either the default

2090 *namespace* specified in the header of an XML document or they may be associated with
 2091 one or more alternate *namespaces*. All elements or attributes associated with a *namespace*
 2092 that is not the default *namespace*, must include a prefix (e.g., x:) as part of the name of
 2093 the element or attribute to associate it with the proper *namespace*. See *Section C - Schema*
 2094 *and Namespace Declaration Information* for details on the structure for XML headers.

2095 The names of the elements and attributes declared in a *namespace* may be identified with
 2096 a different prefix than the prefix that signifies that specific *namespace*. These prefixes are
 2097 called *namespace* aliases. As an example, MTConnect Standard specific *namespaces* are
 2098 designated as m: and the names of the elements and attributes defined in that *namespace*
 2099 have an alias prefix of mt : which designates these names as MTConnect Standard specific
 2100 vocabulary; e.g., mt :MTConnectDevices.

2101 XML documents are encoded with a hierarchy of elements. In general, XML elements
 2102 may contain *child elements*, CDATA, or both. However, in the MTConnect Standard,
 2103 an element **MUST NOT** contain mixed content; meaning it cannot contain both *child*
 2104 *elements* and CDATA.

2105 The *semantic data model* defined for each *response document* specifies the elements and
 2106 *child elements* that may appear in a document. The *semantic data model* also defines the
 2107 number of times each element and *child element* may appear in the document.

2108 *Example 6* demonstrates the hierarchy of XML elements and *child elements* used to form
 2109 an XML document:

Example 6: Example of hierarchy of XML elements

```

2110 1 <Root Level>      (Parent Element)
2111 2   <First Level>  (Child Element to Root Level and
2112 3   Parent Element to Second Level)
2113 4     <Second Level> (Child Element to First Level
2114 5     and Parent Element to Third Level)
2115 6       <Third Level name="N1"></Third Level>
2116 7       (Child Element to Second Level)
2117 8       <Third Level name="N2"></Third Level>
2118 9       (Child Element to Second Level)
2119 10      <Third Level name="N3"></Third Level>
2120 11      (Child Element to Second Level)
2121 12      </Second Level> (end-tag for Second Level)
2122 13      </First Level> (end-tag for First Level)
2123 14      </Root Level> (end-tag for Root Level)
  
```

2124 In the *Example 6*, *Root Level* and *First Level* have one *child element* (sub-elements) each
 2125 and *Second Level* has three *child elements*; each called *Third Level*. Each *Third Level*
 2126 element has a different name attribute. Each level in the structure is an element and each
 2127 lower level element is a *child element*.

2128 C Schema and Namespace Declaration Information

2129 There are four pseudo-attributes typically included in the header of a *response document*
 2130 that declare the *schema* and *namespace* for the document. Each of these pseudo-attributes
 2131 provides specific information for a client software application to properly interpret the
 2132 content of the *response document*.

2133 The pseudo-attributes include:

2134 • `xmlns:xsi` – The `xsi` portion of this attribute name stands for *XML Schema*
 2135 instance. An *XML Schema* instance provides information that may be used by a
 2136 software application to interpret XML specific information within a document. See
 2137 the W3C website for more details on `xmlns:xsi`.

2138 • `xmlns` – Declares the default *namespace* associated with the content of the *re-*
 2139 *sponse document*. The default *namespace* is considered to apply to all elements and
 2140 attributes whenever the name of the element or attribute does not contain a prefix
 2141 identifying an alternate *namespace*.

2142 The value of this attribute is an URN identifying the name of the file that defines the details
 2143 of the *namespace* content. This URN provides a unique identify for the *namespace*.

2144 • `xmlns:m` – Declares the MTConnect specific *namespace* associated with the con-
 2145 tent of the *response document*. There may be multiple *namespaces* declared for an
 2146 XML document. Each may be associated to the default *namespace* or it may be to-
 2147 tally independent. The `:m` designates that this is a specific MTConnect *namespace*
 2148 which is directly associated with the default *namespace*.

2149 Note: See *Section D - Extensibility* for details regarding extended *namespaces*.

2150 The value associated with this attribute is an URN identifying the name of the file that
 2151 defines the details of the *namespace* content.

2152 • `xsi:schemaLocation` - Declares the name for the *schema* associated with the
 2153 *response document* and the location of the file that contains the details of the *schema*
 2154 for that document.

2155 The value associated with this attribute has two parts:

- 2156 • A URN identifying the name of the specific *XML Schema* instance associated with
2157 the *response document*.

- 2158 • The path to the location where the file describing the specific *XML Schema* instance
2159 is located. If the file is located in the same root directory where the *agent* is installed,
2160 then the local path MAY be declared. Otherwise, a fully qualified URL must be
2161 declared to identify the location of the file.

2162 Note: In the format of the value associated with `xsi:schemaLocation`,
2163 the URN and the path to the *schema* file **MUST** be separated by a “space”.

2164 In *Example 7*, the first line is the XML declaration. The second line is a *root element*
2165 called `MTConnectDevices`. The remaining four lines are the pseudo-attributes of
2166 `MTConnectDevices` that declare the XML *schema* and *namespace* associated with
2167 an *MTConnectDevices Response Document*.

Example 7: Example of schema and namespace declaration

```
2168 1 <?xml version="1.0" encoding="UTF-8"?>  
2169 2 <MTConnectDevices  
2170 3   xmlns:xsi=http://www.w3.org/2001/XMLSchema-instance  
2171 4   xmlns="urn:mtconnect.org:MTConnectDevices:1.3"  
2172 5   xmlns:m="urn:mtconnect.org:MTConnectDevices:1.3"  
2173 6   xsi:schemaLocation="urn:mtconnect.org:  
2174 7   _MTConnectDevices:1.3_/schemas/MTConnectDevices\textunderscore_  
2175     1.3.xsd">
```

2176 The format for the values provided for each of the pseudo-attributes **MUST** reference
2177 the *semantic data model* (e.g., `MTConnectDevices`, `MTConnectStreams`, `MTCon-`
2178 `nectAssets`, or `MTConnectError`) and the version (i.e.; 1.1, 1.2, 1.3, etc.) of the
2179 `MTConnect` Standard that depict the *schema* and *namespace(s)* associated with a specific
2180 *response document*.

2181 When an implementer chooses to extend an `MTConnect data model` by adding custom data
2182 types or additional *structural elements*, the *schema* and *namespace* for that *data model*
2183 should be updated to reflect the additional content. When this is done, the *namespace* and
2184 *schema* information in the header should be updated to reflect the URI for the extended
2185 *namespace* and *schema*.

2186 D Extensibility

2187 MTConnect is an extensible standard, which means that implementers **MAY** extend the
 2188 *data models* defined in the various sections of the MTConnect Standard to include infor-
 2189 mation required for a specific implementation. When these *data models* are encoded using
 2190 XML, the methods for extending these *data models* are defined by the rules established
 2191 for extending any XML schema (see the W3C website for more details on extending XML
 2192 data models).

2193 The following are typical extensions that **MAY** be considered in the MTConnect *data*
 2194 *models*:

- 2195 • Additional `type` and `subtype` values for *DataItems*.
- 2196 • Additional *structural elements* as containers.
- 2197 • Additional `Composition` elements.
- 2198 • New `Asset` types that are sub-typed from the abstract `Asset` type.
- 2199 • *child elements* that may be added to specific XML elements contained within the
 2200 *MTConnect Information Models*. These extended elements **MUST** be identified in
 2201 a separate *namespace*.

2202 When extending an MTConnect *data model*, there are some basic rules restricting changes
 2203 to the MTConnect *data models*.

2204 When extending an MTConnect *data model*, an implementer:

- 2205 • **MUST NOT** add new value for category for *DataItems*,
- 2206 • **MUST NOT** add new *root elements*,
- 2207 • **SHOULD NOT** add new *top level Components*, and
- 2208 • **MUST NOT** add any new attributes or include any sub-elements to `Composi-`
 2209 `tion`.

2210 Note: Throughout the documents additional information is provided where
 2211 extensibility may be acceptable or unacceptable to maintain compliance with
 2212 the MTConnect Standard.

2213 When a *schema* representing a *data model* is extended, the *schema* and *namespace* dec-
 2214 laration at the beginning of the corresponding *response document* **MUST** be updated to
 2215 reflect the new *schema* and *namespace* so that a client software application can properly
 2216 validate the *response document*.

2217 An XML example of a *schema* and *namespace* declaration, including an extended *schema*
 2218 and *namespace*, is shown in *Example 8*:

Example 8: Example of extended schema and namespace in declaration

```
2219 1 <?xml version="1.0" encoding="UTF-8"?>
2220 2 <MTConnectDevices
2221 3   xmlns:xsi=http://www.w3.org/2001/XMLSchema-instance
2222 4   xmlns="urn:mtconnect.org:MTConnectDevices:1.3"
2223 5   xmlns:m="urn:mtconnect.org:MTConnectDevices:1.3"
2224 6   xmlns:x="urn:MyLocation:MyFile:MyVersion"
2225 7   xsi:schemaLocation="urn:MyLocation:MyFile:MyVersion
2226 8   /schemas/MyFileName.xsd" />
```

2227 In this example:

- 2228 • `xmlns:x` is added in Line 6 to identify the *XML Schema* instance for the extended
 2229 *schema*. *element names* identified with an “x” prefix are associated with this specific
 2230 *XML Schema* instance.

2231 Note: The “x” prefix **MAY** be replaced with any prefix that the implementer
 2232 chooses for identifying the extended *schema* and *namespace*.

- 2233 • `xsi:schemaLocation` is modified in Line 7 to associate the *namespace* URN
 2234 with the URL specifying the location of *schema* file.

- 2235 • `MyLocation`, `MyFile`, `MyVersion`, and `MyFileName` in Lines 6 and 7 **MUST**
 2236 be replaced by the actual name, version, and location of the extended *schema*.

2237 When an extended *schema* is implemented, each *structural element*, *DataItem*, and asset
 2238 defined in the extended *schema* **MUST** be identified in each respective *response document*
 2239 by adding a prefix to the XML *element name* associated with that *structural element*,
 2240 *DataItem*, or asset. The prefix identifies the *schema* and *namespace* where that XML
 2241 Element is defined.
