

MTConnect[®] Standard
Part 1.0 – Overview and Fundamentals
Version 1.8.0

Prepared for: MTConnect Institute
Prepared on: September 6, 2021

MTConnect[®] is a registered trademark of AMT - The Association for Manufacturing Technology. Use of *MTConnect* is limited to use as specified on <http://www.mtconnect.org/>.

MTConnect Specification and Materials

The Association For Manufacturing Technology (AMT) owns the copyright in this MTConnect Specification or Material. AMT grants to you a non-exclusive, non-transferable, revocable, non-sublicensable, fully-paid-up copyright license to reproduce, copy and redistribute this MTConnect Specification or Material, provided that you may only copy or redistribute the MTConnect Specification or Material in the form in which you received it, without modifications, and with all copyright notices and other notices and disclaimers contained in the MTConnect Specification or Material.

If you intend to adopt or implement an MTConnect Specification or Material in a product, whether hardware, software or firmware, which complies with an MTConnect Specification, you shall agree to the MTConnect Specification Implementer License Agreement (“Implementer License”) or to the MTConnect Intellectual Property Policy and Agreement (“IP Policy”). The Implementer License and IP Policy each sets forth the license terms and other terms of use for MTConnect Implementers to adopt or implement the MTConnect Specifications, including certain license rights covering necessary patent claims for that purpose. These materials can be found at www.MTConnect.org, or by contacting <mailto:info@MTConnect.org>.

MTConnect Institute and AMT have no responsibility to identify patents, patent claims or patent applications which may relate to or be required to implement a Specification, or to determine the legal validity or scope of any such patent claims brought to their attention. Each MTConnect Implementer is responsible for securing its own licenses or rights to any patent or other intellectual property rights that may be necessary for such use, and neither AMT nor MTConnect Institute have any obligation to secure any such rights.

This Material and all MTConnect Specifications and Materials are provided “as is” and MTConnect Institute and AMT, and each of their respective members, officers, affiliates, sponsors and agents, make no representation or warranty of any kind relating to these materials or to any implementation of the MTConnect Specifications or Materials in any product, including, without limitation, any expressed or implied warranty of noninfringement, merchantability, or fitness for particular purpose, or of the accuracy, reliability, or completeness of information contained herein. In no event shall MTConnect Institute or AMT be liable to any user or implementer of MTConnect Specifications or Materials for the cost of procuring substitute goods or services, lost profits, loss of use, loss of data or any incidental, consequential, indirect, special or punitive damages or other direct damages, whether under contract, tort, warranty or otherwise, arising in any way out of access, use or inability to use the MTConnect Specification or other MTConnect Materials, whether or not they had advance notice of the possibility of such damage.

1 1 Overview of MTConnect

2 MTConnect is a data and information exchange standard that is based on a *data dictionary*
3 of terms describing information associated with manufacturing operations. The standard
4 also defines a series of *semantic data models* that provide a clear and unambiguous repre-
5 sentation of how that information relates to a manufacturing operation. The MTConnect
6 Standard has been designed to enhance the data acquisition capabilities from equipment in
7 manufacturing facilities, to expand the use of data driven decision making in manufactur-
8 ing operations, and to enable software applications and manufacturing equipment to move
9 toward a plug-and-play environment to reduce the cost of integration of manufacturing
10 software systems.

11 The MTConnect standard supports two primary communications methods – *Request/Re-*
12 *sponse* and *Publish/Subscribe* type of communications. The *Request/Response* communi-
13 cations structure is used throughout this document to describe the functionality provided
14 by MTConnect. See *Section 8.3.6 - Streaming Data* for details describing the functionality
15 of the *Publish/Subscribe* communications structure available from an *Agent*.

16 Although the MTConnect Standard has been defined to specifically meet the requirements
17 of the manufacturing industry, it can also be readily applied to other application areas as
18 well.

19 The MTConnect Standard is an open, royalty free standard – meaning that it is available
20 for anyone to download, implement, and utilize in software systems at no cost to the
21 implementer.

22 The *semantic data models* defined in the MTConnect Standard provide the information re-
23 quired to fully characterize data with both a clear and unambiguous meaning and a mech-
24 anism to directly relate that data to the manufacturing operation where the data originated.
25 Without a *semantic data model*, client software applications must apply an additional layer
26 of logic to raw data to convey this same level of meaning and relationship to manufacturing
27 operations. The approach provided in the MTConnect Standard for modeling and organiz-
28 ing data allows software applications to easily interpret data from a wide variety of data
29 sources which reduces the complexity and effort to develop applications.

30 The data and information from a broad range of manufacturing equipment and systems
31 are addressed by the MTConnect Standard. Where the *data dictionary* and *semantic data*
32 *models* are insufficient to define some information within an implementation, an imple-
33 menter may extend the *data dictionary* and *semantic data models* to address their specific
34 requirements. See *Section 6.7 - Extensibility* for guidelines related to extensibility of the
35 MTConnect Standard.

36 To assist in implementation, the MTConnect Standard is built upon the most prevalent
37 standards in the manufacturing and software industries. This maximizes the number of
38 software tools available for implementation and provides the highest level of interoper-
39 ability with other standards, software applications, and equipment used throughout manu-
40 facturing operations.

41 Current MTConnect implementations are based on HTTP as a transport protocol and XML
42 as a language for encoding each of the *semantic data models* into electronic documents.
43 All software examples provided in the various MTConnect Standard documents are based
44 on these two core technologies.

45 The base functionality defined in the MTConnect Standard is the *data dictionary* describ-
46 ing manufacturing information and the *semantic data models*. The transport protocol and
47 the programming language used to represent or transfer the information provided by the
48 *semantic data models* are not restricted in the standard to HTTP and XML. Therefore,
49 other protocols and programming languages may be used to represent the semantic models
50 and/or transport the information provided by these data models between an *Agent* (server)
51 and a client software application as may be required by a specific implementation.

52 Note: The term "document" is used with different meanings in the MTConnect Stan-
53 dard:

54 • Meaning 1: The MTConnect Standard itself is comprised of multiple documents
55 each addressing different aspects of the Standard. Each document is referred to as a
56 Part of the Standard.

57 • Meaning 2: In an MTConnect implementation, the electronic documents that are
58 published from a data source and stored by an *Agent*.

59 • Meaning 3: In an MTConnect implementation, the electronic documents generated
60 by an *Agent* for transmission to a client software application.

61 The following will be used throughout the MTConnect Standard to distinguish be-
62 tween these different meanings for the term "document":

63 • MTConnect Document(s) or Document(s) shall be used to refer to printed or elec-
64 tronic document(s) that represent a Part(s) of the MTConnect Standard.

65 • All reference to electronic documents that are received from a data source and stored
66 in an *Agent* shall be referred to as "*Document(s)*" and are typically provided with a
67 prefix identifier; e.g. *Asset Document*.

- 68 • All references to electronic documents generated by an *Agent* and sent to a client
69 software application shall be referred to as a "*Response Document*".

70 When used with no additional descriptor, the form "document" shall be used to refer to
71 any printed or electronic document.

72 Manufacturing software systems implemented utilizing MTConnect can be represented by
73 a very simple structure as shown in *Figure 1* .

Figure 1: Basic MTConnect Implementation Structure

74 The three basic modules that comprise a software system implemented using MTConnect
75 are:

76 Equipment: Any data source. In the MTConnect Standard, equipment is defined as any
77 tangible property that is used to equip the operations of a manufacturing facility. Examples
78 of equipment are machine tools, ovens, sensor units, workstations, software applications,
79 and bar feeders.

80 Agent: Software that collects data published from one or more piece(s) of equipment,
81 organizes that data in a structured manner, and responds to requests for data from client
82 software systems by providing a structured response in the form of a *Response Document*
83 that is constructed using the *semantic data models* defined in the Standard.

84 Note: The *Agent* may be fully integrated into the piece of equipment or the *Agent* may be
85 independent of the piece of equipment. Implementation of an *Agent* is the responsibility
86 of the supplier of the piece of equipment and/or the implementer of the *Agent*.

87 Client Software Application: Software that requests data from *Agents* and processes
88 that data in support of manufacturing operations.

89 Based on *Figure 1* , it is important to understand that the MTConnect Standard only ad-
90 dresses the following functionality and behavior of an *Agent*:

- 91 ● the method used by a client software application to request information from an
92 *Agent*.
- 93 ● the response that an *Agent* provides to a client software application.
- 94 ● a *data dictionary* used to provide consistency in understanding the meaning of data
95 reported by a data source.
- 96 ● the description of the *semantic data models* used to structure *Response Documents*
97 provided by an *Agent* to a client software application.

98 These functions are the primary building blocks that define the *Base Functional Structure*
99 of the MTConnect Standard.

100 There are a wide variety of data sources (equipment) and data consumption systems (client
101 software systems) used in manufacturing operations. There are also many different uses
102 for the data associated with a manufacturing operation. No single approach to implement-
103 ing a data communication system can address all data exchange and data management
104 functions typically required in the data driven manufacturing environment. MTConnect
105 has been uniquely designed to address this diversity of data types and data usages by pro-
106 viding different *semantic data models* for different data application requirements:

107 Data Collection: The most common use of data in manufacturing is the collection of
108 data associated with the production of products and the operation of equipment that pro-
109 duces those products. The MTConnect Standard provides comprehensive *semantic data*
110 *models* that represent data collected from manufacturing operations. These *semantic data*
111 *models* are detailed in *MTConnect Standard: Part 2.0 - Devices Information Model* and
112 *MTConnect Standard: Part 3.0 - Streams Information Model* of the MTConnect Standard.

113 Inter-operations Between Pieces of Equipment: The MTConnect Standard provides
114 an *Interaction Model* that structures the information required to allow multiple pieces of
115 equipment to coordinate actions required to implement manufacturing activities. This
116 *Interaction Model* is an implementation of a *Request/Response* messaging structure. This
117 *Interaction Model* is called `Interfaces` which is detailed in *MTConnect Standard: Part*
118 *5.0 - Interfaces* of the MTConnect Standard.

119 Shared Data: Certain information used in a manufacturing operation is commonly
120 shared amongst multiple pieces of equipment and/or software applications. This infor-
121 mation is not typically "owned" by any one manufacturing resource. The MTConnect

122 Standard represents this information through a series of *semantic data models* – each de-
123 scribing different types of information used in the manufacturing environment. Each type
124 of information is called an *MTCConnect Asset*. *MTCConnect Assets* are detailed in *MTCCon-*
125 *nect Standard: Part 4.0 - Assets Information Model*, and its sub-Parts, of the MTCConnect
126 Standard.

127 **2 Purpose of This Document**

128 This document, *MTConnect Standard Part 1.0 - Overview and Fundamentals* of the *MT-*
129 *Connect* Standard, addresses two major topics relating to the MTConnect Standard. The
130 first sections of the document define the organization of the documents used to describe the
131 MTConnect Standard; including the terms and terminology used throughout the Standard.
132 The balance of the document defines the following:

- 133 • Operational concepts describing how an *Agent* should organize and structure data
134 that has been collected from a data source.
- 135 • Definition and structure of the *Response Documents* supplied by an *Agent*.
- 136 • The protocol used by a client software application to communicate with an *Agent*.

137 3 Terminology and Conventions

138 3.1 Glossary

139 CDATA

140 General meaning:

141 An abbreviation for Character Data.

142 CDATA is used to describe a value (text or data) published as part of an XML ele-
143 ment.

144 For example, "This is some text" is the CDATA in the XML element:

```
145 <Message ...>This is some text</Message>
```

146 Appears in the documents in the following form: CDATA

147 HTTP

148 Hyper-Text Transport Protocol. The protocol used by all web browsers and web
149 applications.

150 Note: HTTP is an IETF standard and is defined in RFC 7230.

151 See <https://tools.ietf.org/html/rfc7230> for more information.

152 NMTOKEN

153 The data type for XML identifiers.

154 Note: The identifier must start with a letter, an underscore "_" or a colon. The next
155 character must be a letter, a number, or one of the following ".", "-", "_", ":". The
156 identifier must not have any spaces or special characters.

157 Appears in the documents in the following form: NMTOKEN.

158 REST

159 Stands for REpresentational State Transfer: A software architecture where a client
160 software application and server move through a series of state transitions based
161 solely on the request from the client and the response from the server.

162 Appears in the documents in the following form: REST.

163 URI

164 Stands for Universal Resource Identifier.

165 See <http://www.w3.org/TR/uri-clarification/#RFC3986>

166 URL

167 Stands for Uniform Resource Locator.

168 See <http://www.w3.org/TR/uri-clarification/#RFC3986>

169 URN

170 Stands for Uniform Resource Name.

171 See <http://www.w3.org/TR/uri-clarification/#RFC3986>

172 UTC/GMT

173 Stands for Coordinated Universal Time/Greenwich Mean Time.

174 UTC/GMT is the primary time standard by which the world regulates clocks and
175 time.

176 The time stamp for all information reported in an *MTCConnect Response Document*
177 is provided in UTC/GMT format.

178 UUID

179 General meaning:

180 Stands for Universally Unique Identifier. (Can also be referred to as a GUID in some
181 literature Globally Unique Identifier).

182 Note: Defined in RFC 4122 of the IETF. See <https://www.ietf.org/rfc/rfc4122.txt>
183 for more information.

184 Appears in the documents in the following form: UUID.

185 Used as an attribute for an XML element:

186 Used as an attribute that provides a unique identity for a piece of information re-
187 ported by an *Agent*.

188 Appears in the documents in the following form: `uuid`.

189 W3C

190 The World Wide Web Consortium (W3C) is an international community that devel-
191 ops open standards to ensure the long-term growth of the Web.

192 See <https://www.w3.org/>.

193 XML

194 Stands for eXtensible Markup Language.

195 XML defines a set of rules for encoding documents that both a human-readable and
196 machine-readable.

197 XML is the language used for all code examples in the MTCConnect Standard.

198 Refer to <http://www.w3.org/XML> for more information about XML.

199 XPath

200 General meaning:

201 XPath is a command structure that describes a way for a software system to locate
202 information in an XML document.

203 XPath uses an addressing syntax based on a path through the document's logical
204 structure.

205 See <http://www.w3.org/TR/xpath> for more information on XPath.

206 Appears in the documents in the following form: XPath.

207 ***Abstract Element***

208 An element that defines a set of common characteristics that are shared by a group
209 of elements.

210 An abstract element cannot appear in a document. In a specific implementation of
211 a schema, an abstract element is replaced by a derived element that is itself not an
212 abstract element. The characteristics for the derived element are inherited from the
213 abstract element.

214 Appears in the documents in the following form: abstract.

215 ***Adapter***

216 An optional piece of hardware or software that transforms information provided by
217 a piece of equipment into a form that can be received by an *Agent*.

218 Appears in the documents in the following form: adapter.

219 ***Agent***

220 Refers to an MTConnect Agent.

221 Software that collects data published from one or more piece(s) of equipment, orga-
222 nizes that data in a structured manner, and responds to requests for data from client
223 software systems by providing a structured response in the form of a *Response Doc-*
224 *ument* that is constructed using the *semantic data models* defined in the Standard.

225 Appears in the documents in the following form: *Agent*.

226 ***alarm limits***

227 A set of limits used to trigger warning or alarm indicators.

228 ***Application Programming Interface***

229 A set of methods to provide communications between software applications.

230 The API defined in the MTConnect Standard describes the methods for providing
231 the *Request/Response* Information Exchange between an *Agent* and client software
232 applications.

233 Appears in the documents in the following forms: Application Programming Inter-
234 face or API.

235 ***Archetype***

236 General Description of an *MTCConnect Asset*:

237 Archetype is a class of *MTCConnect Assets* that provides the requirements, con-
238 straints, and common properties for a type of *MTCConnect Asset*.

239 Appears in the documents in the following form: Archetype.

240 Used as an XML term describing an *MTCConnect Asset*:

241 In an XML representation of the *Asset Information Models*, Archetype is an ab-
242 stract element that is replaced by a specific type of *Asset Archetype*.

243 Appears in the documents in the following form: Archetype

244 ***Asset***

245 item, thing or entity that has potential or actual value to an organization *Ref:ISO*
246 *55000:2014(en)*

247 Note 1 to entry: Value can be tangible or intangible, financial or non-financial,
248 and includes consideration of risks and liabilities. It can be positive or negative
249 at different stages of the asset life.

250 Note 2 to entry: Physical assets usually refer to equipment, inventory and prop-
251 erties owned by the organization. Physical assets are the opposite of intangible
252 assets, which are non-physical assets such as leases, brands, digital assets, use
253 rights, licences, intellectual property rights, reputation or agreements.

254 Note 3 to entry: A grouping of assets referred to as an asset system could also
255 be considered as an asset.

256

257 ***Asset Document***

258 An electronic document published by an *Agent* in response to a *Request* for infor-
259 mation from a client software application relating to Assets.

260 ***Attachment***

261 The connection by which one thing is associated with another.

262 ***Attribute***

263 A term that is used to provide additional information or properties for an element.

264 Appears in the documents in the following form: attribute.

265 ***Base Functional Structure***

266 A consistent set of functionalities defined by the MTConnect Standard. This func-
267 tionality includes the protocol(s) used to communicate data to a client software ap-
268 plication, the *semantic data models* defining how that data is organized into *Re-*
269 *sponse Documents*, and the encoding of those *Response Documents*.

270 Appears in the documents in the following form: *Base Functional Structure*.

271 ***buffer***

272 General meaning:

273 A section of an *Agent* that provides storage for information published from pieces
274 of equipment.

275 Used relative to *Streaming Data*:

276 A section of an *Agent* that provides storage for information relating to individual
277 pieces of *Streaming Data*.

278 Appears in the documents in the following form: *buffer*.

279 Used relative to *MTConnect Assets*:

280 A section of an *Agent* that provides storage for *Asset Documents*.

281 Appears in the documents in the following form: *assets buffer*.

282 ***Child Element***

283 A portion of a data modeling structure that illustrates the relationship between an
284 element and the higher-level *Parent Element* within which it is contained.

285 Appears in the documents in the following form: *Child Element*.

286 ***Client***

287 A process or set of processes that send *Requests* for information to an *Agent*; e.g.
288 software applications or a function that implements the *Request* portion of an *Inter-*
289 *face Interaction Model*.

290 Appears in the documents in the following form: *client*.

291 ***Component***

292 General meaning:

293 A *Structural Element* that represents a physical or logical part or subpart of a piece
294 of equipment.

295 Appears in the documents in the following form: *Component*.

296 Used in *Information Models*:

297 A data modeling element used to organize the data being retrieved from a piece of
298 equipment.

- 299 • When used as an XML container to organize *Lower Level* Component ele-
300 ments.

301 Appears in the documents in the following form: *Component s*.

- 302 • When used as an abstract XML element. *Component* is replaced in a data
303 model by a type of *Component* element. *Component* is also an XML con-
304 tainer used to organize *Lower Level* Component elements, *Data Entities*, or
305 both.

306 Appears in the documents in the following form: *Component*.

307 ***Composition***

308 General meaning:

309 Data modeling elements that describe the lowest level basic structural or functional
310 building blocks contained within a *Component* element.

311 Appears in the documents in the following form: *Composition*

312 Used in *Information Models*:

313 A data modeling element used to organize the data being retrieved from a piece of
314 equipment.

- 315 • When used as an XML container to organize *Composition* elements.

316 Appears in the documents in the following form: *Compositions*

- 317 • When used as an abstract XML element. *Composition* is replaced in a data
318 model by a type of *Composition* element.

319 Appears in the documents in the following form: *Composition*.

320 ***Condition***

321 An indicator of the ability of a piece of equipment or *Component* to function to
322 specification.

323 ***control limits***

324 A set of limits used to indicate whether a process variable is stable and in control.

325 ***Controlled Vocabulary***

326 A restricted set of values that may be published as the *Valid Data Value* for a *Data*
327 *Entity*.

328 Appears in the documents in the following form: *Controlled Vocabulary*.

329 ***current***

330 occurring in or existing at the present time.

331 ***Current Request***

332 A *Current Request* is a *Request* to an *Agent* to produce an *MTCConnectStreams Re-*
333 *sponse Document* containing the *Observations Information Model* for a snapshot of
334 the latest *observations* at the moment of the *Request* or at a given *sequence number*.

335 ***data dictionary***

336 Listing of standardized terms and definitions used in *MTCConnect Information Mod-*
337 *els*.

338 Appears in the documents in the following form: *data dictionary*.

339 ***Data Entity***

340 A primary data modeling element that represents all elements that either describe
341 data items that may be reported by an *Agent* or the data items that contain the actual
342 data published by an *Agent*.

343 Appears in the documents in the following form: *Data Entity*.

344 ***Data Item***

345 General meaning:

346 Descriptive information or properties and characteristics associated with a *Data En-*
347 *tity*.

348 Appears in the documents in the following form: data item.

349 Used in an XML representation of a *Data Entity*:

350 ● When used as an XML container to organize `DataItem` elements.

351 Appears in the documents in the following form: `DataItems`.

352 ● When used to represent a specific *Data Entity*, the form `DataItem` is an XML
353 element.

354 Appears in the documents in the following form: `DataItem`.

355 ***Data Set***

356 A set of *key-value pairs* where each entry is uniquely identified by the *key*.

357 ***Data Source***

358 Any piece of equipment that can produce data that is published to an *Agent*.

359 Appears in the documents in the following form: data source.

360 ***Data Streaming***

361 A method for an *Agent* to provide a continuous stream of information in response to
362 a single *Request* from a client software application.

363 Appears in the documents in the following form: *Data Streaming*.

364 ***Deprecated***

365 An indication that specific content in an *MTConnect Document* is currently usable
366 but is regarded as being obsolete or superseded. It is recommended that deprecated
367 content should be avoided.

368 Appears in the documents in the following form: **DEPRECATED** .

369 ***Deprecation Warning***

370 An indicator that specific content in an *MTConnect Document* may be changed to
371 **DEPRECATED** in a future release of the standard.

372 Appears in the documents in the following form: **DEPRECATION WARNING** .

373 ***Devices Information Model***

374 A set of rules and terms that describes the physical and logical configuration for a
375 piece of equipment and the data that may be reported by that equipment.

376 Appears in the documents in the following form: *Devices Information Model*.

377 ***Document***

378 A piece of written, printed, or electronic matter that provides information or evi-
379 dence that serves as an official record.

380 ***Document Body***

381 The portion of the content of an *MTConnect Response Document* that is defined
382 by the relative *MTConnect Information Model*. The *Document Body* contains the
383 *Structural Elements* and *Data Entities* reported in a *Response Document*.

384 Appears in the documents in the following form: *Document Body*.

385 ***Document Header***

386 The portion of the content of an *MTConnect Response Document* that provides infor-
387 mation from an *Agent* defining version information, storage capacity, protocol, and
388 other information associated with the management of the data stored in or retrieved
389 from the *Agent*.

390 Appears in the documents in the following form: *Document Header*.

391 ***electric current***

392 The rate of flow of electric charge.

393 ***Element***

394 Refers to an XML element.

395 An XML element is a logical portion of an XML document or schema that begins
396 with a `start-tag` and ends with a corresponding `end-tag`.397 The information provided between the `start-tag` and `end-tag` may contain
398 attributes, other elements (sub-elements), and/or CDATA.399 Note: Also, an XML element may consist of an `empty-element` tag. Refer
400 to *Appendix B* for more information on element tags.401 Appears in the documents in the following form: `element`.402 ***Element Name***403 A descriptive identifier contained in both the `start-tag` and `end-tag` of an
404 XML element that provides the name of the element.405 Appears in the documents in the following form: `element name`.406 Used to describe the name for a specific XML element:407 Reference to the name provided in the `start-tag`, `end-tag`, or `empty-element`
408 `tag` for an XML element.409 Appears in the documents in the following form: *Element Name*.410 ***engineering units***411 A quantity, dimension, or magnitude used in engineering adopted as a standard in
412 terms of which the magnitude of other quantities of the same kind can be expressed
413 or calculated.414 ***Equipment***415 Represents anything that can publish information and is used in the operations of a
416 manufacturing facility shop floor. Examples of equipment are machine tools, ovens,
417 sensor units, workstations, software applications, and bar feeders.418 Appears in the documents in the following form: `equipment` or `piece of equipment`.419 ***Equipment Metadata***420 See *Metadata*421 ***Error Information Model***422 The rules and terminology that describes the *Response Document* returned by an
423 *Agent* when it encounters an error while interpreting a *Request* for information from
424 a client software application or when an *Agent* experiences an error while publishing
425 the *Response* to a *Request* for information.426 Appears in the documents in the following form: *Error Information Model*.

427 ***Extensible***

428 The ability for an implementer to extend *MTConnect Information Models* by adding
429 content not currently addressed in the MTConnect Standard.

430 ***Fault State***

431 In the MTConnect Standard, a term that indicates the reported status of a *Condition*
432 category *Data Entity*.

433 Appears in the documents in the following form: *Fault State*.

434 ***Force***

435 A push or pull on a mass which results in an acceleration.

436 ***heartbeat***

437 General meaning:

438 A function that indicates to a client application that the communications connection
439 to an *Agent* is still viable during times when there is no new data available to report
440 often referred to as a "keep alive" message.

441 Appears in the documents in the following form: *heartbeat*.

442 When used as part of an *HTTP Request*:

443 The form `heartbeat` is used as a parameter in the query portion of an *HTTP*
444 *Request Line*.

445 Appears in the documents in the following form: `heartbeat`.

446 ***Higher Level***

447 A nested element that is above a lower level element.

448 ***HTTP Error Message***

449 In the MTConnect Standard, a response provided by an *Agent* indicating that an
450 *HTTP Request* is incorrectly formatted or identifies that the requested data is not
451 available from the *Agent*.

452 Appears in the documents in the following form: *HTTP Error Message*.

453 ***HTTP Header***

454 In the MTConnect Standard, the content of the *Header* portion of either an *HTTP*
455 *Request* from a client software application or an *HTTP Response* from an *Agent*.

456 Appears in the documents in the following form: *HTTP Header*.

457 HTTP Message

458 An *HTTP Message* consists of requests from client to server and responses from
459 server to client. *Ref:IETF:RFC-2616*

460 HTTP Method

461 In the MTConnect Standard, a portion of a command in an *HTTP Request* that indi-
462 cates the desired action to be performed on the identified resource; often referred to
463 as verbs.

464 HTTP Request

465 In the MTConnect Standard, a communications command issued by a client soft-
466 ware application to an *Agent* requesting information defined in the *HTTP Request*
467 *Line*.

468 Appears in the documents in the following form: *HTTP Request*.

469 HTTP Request Line

470 In the MTConnect Standard, the first line of an *HTTP Request* describing a specific
471 *Response Document* to be published by an *Agent*.

472 Appears in the documents in the following form: *HTTP Request Line*.

473 HTTP Response

474 In the MTConnect Standard, the information published from an *Agent* in reply to
475 an *HTTP Request*. An *HTTP Response* may be either a *Response Document* or an
476 *HTTP Error Message*.

477 Appears in the documents in the following form: *HTTP Response*.

478 HTTP Server

479 In the MTConnect Standard, a software program that accepts *HTTP Requests* from
480 client software applications and publishes *HTTP Responses* as a reply to those *Re-*
481 *quests*.

482 Appears in the documents in the following form: *HTTP Server*.

483 HTTP Status Code

484 In the MTConnect Standard, a numeric code contained in an *HTTP Response* that
485 defines a status category associated with the *Response* either as a success status or a
486 category of an HTTP error.

487 Appears in the documents in the following form: *HTTP Status Code*.

488 ***id***489 General meaning:

490 An identifier used to distinguish a piece of information.

491 Appears in the documents in the following form: *id*.492 Used as an XML attribute:493 When used as an attribute for an XML element - *Structural Element*, *Data Entity*, or
494 *Asset*. *id* provides a unique identity for the element within an XML document.495 Appears in the documents in the following form: *id*.496 ***Implementation***

497 A specific instantiation of the MTConnect Standard.

498 ***Information Model***499 The rules, relationships, and terminology that are used to define how information is
500 structured.501 For example, an information model is used to define the structure for each *MTCon-*
502 *nect Response Document*; the definition of each piece of information within those
503 documents and the relationship between pieces of information.504 Appears in the documents in the following form: *Information Model*.505 ***instance***506 Describes a set of *Streaming Data* in an *Agent*. Each time an *Agent* is restarted with
507 an empty *buffer*, data placed in the *buffer* represents a new *instance* of the *Agent*.508 Appears in the documents in the following form: *instance*.509 ***Interaction Model***510 Defines how information is exchanged across an *Interface* between independent sys-
511 tems.512 ***Interface***

513 The means by which communication is achieved between independent systems.

514 ***key***515 A unique identifier in a *key-value pair* association.516 ***key-value pair***517 An association between an identifier referred to as the *key* and a value which taken
518 together create a *key-value pair*. When used in a set of *key-value pairs* each *key* is
519 unique and will only have one value associated with it at any point in time.

520 ***Lower Level***

521 A nested element that is below a higher level element.

522 ***lower limit***

523 The lower conformance boundary for a variable.

524 Note: immediate concern or action may be required.

525 ***lower warning***

526 The lower boundary indicating increased concern and supervision may be required.

527 ***maximum***

528 A numeric upper constraint.

529 ***Message***

530 A communication in writing, in speech, or by signals.

531 ***Metadata***

532 Data that provides information about other data.

533 For example, *Equipment Metadata* defines both the *Structural Elements* that represent the physical and logical parts and sub-parts of each piece of equipment, the relationships between those parts and sub-parts, and the definitions of the *Data Entities* associated with that piece of equipment.

537 Appears in the documents in the following form: *Metadata* or *Equipment Metadata*.538 ***minimum***

539 A numeric lower constraint.

540 ***MTCConnect Agent***541 See definition for *Agent*.542 ***MTCConnect Asset***

543 An *MTCConnect Asset* is an *Asset* used by the manufacturing process to perform tasks.

545 Note 1 to entry: An *MTCConnect Asset* relies upon an *MTCConnect Device* to provide *observations* and information about itself and the *MTCConnect Device* revises the information to reflect changes to the *MTCConnect Asset* during their interaction. Examples of *MTCConnect Assets* are Cutting Tools, Part Information, Manufacturing Processes, Fixtures, and Files.

550 Note 2 to entry: A singular `assetId` uniquely identifies an *MTCConnect Asset*
551 throughout its lifecycle and is used to track and relate the *MTCConnect Asset* to
552 other *MTCConnect Devices* and entities.

553 Note 3 to entry: *MTCConnect Assets* are temporally associated with a device and
554 can be removed from the device without damage or alteration to its primary
555 functions.

556

557 ***MTCConnect Device***

558 An *MTCConnect Device* is a piece of equipment or a manufacturing system that pro-
559 duces *observations* about itself and/or publishes data using the *MTCConnect Infor-*
560 *mation Model*.

561 ***MTCConnect Document***

562 Printed or electronic document(s) that represent a Part(s) of the MTCConnect Stan-
563 dard.

564 ***MTCConnect Event***

565 An *MTCConnect Event* is an *observation* of either a state or discrete value of the
566 *Component*. *Component* states **SHOULD** have a controlled vocabulary.

567 ***MTCConnect Information Model***

568 See *Information Model*

569 ***MTCConnect Interface***

570 An *Interaction Model* for interoperability between pieces of equipment.

571 ***MTCConnect Request***

572 A communication request for information issued from a client software application
573 to an *Agent*.

574 Appears in the documents in the following form: *MTCConnect Request*.

575 ***MTCConnect XML Document***

576 See *Response Document*.

577 ***MTCConnectAssets Response Document***

578 A *Response Document* published by an *MTCConnect Agent* in response to an *Asset*
579 *Request*.

580 ***MtConnectDevices Response Document***

581 A *Response Document* published by an *MtConnect Agent* in response to a *Probe*
582 *Request*.

583 ***MtConnectErrors Response Document***

584 An electronic document published by an *Agent* whenever it encounters an error
585 while interpreting a *Request* for information from a client software application or
586 when an *Agent* experiences an error while publishing the *Response* to a *Request* for
587 information.

588 Appears in the documents in the following form: *MtConnectErrors Response Doc-*
589 *ument*.

590 ***MtConnectStreams Response Document***

591 A *Response Document* published by an *MtConnect Agent* in response to a *Current*
592 *Request* or a *Sample Request*.

593 ***nominal***

594 The ideal or desired value for a variable.

595 ***observable***

596 A quality, property, or characteristic that can be observed.

597 ***observation***

598 The observed value of a property at a point in time.

599 ***Observations Information Model***

600 An *Information Model* that describes the *Streaming Data* reported by a piece of
601 equipment.

602 ***observe***

603 The act of measuring or determining the value of a property at a point in time.

604 ***organize***

605 The act of containing and owning one or more elements.

606 ***organizer***

607 An element that contains and owns one or more elements.

608 ***parameter***609 General Meaning:

610 A variable that must be given a value during the execution of a program or a com-
611 munications command.

612 When used as part of an *HTTP Request*:

613 Represents the content (keys and associated values) provided in the *Query* portion
614 of an *HTTP Request Line* that identifies specific information to be returned in a
615 *Response Document*.

616 Appears in the documents in the following form: *parameter*.

617 ***Parent Element***

618 An XML element used to organize *Lower Level* child elements that share a common
619 relationship to the *Parent Element*.

620 Appears in the documents in the following form: *Parent Element*.

621 ***Part***

622 *Part* is defined as a discrete item that has both defined and measurable physical
623 characteristics including mass, material and features and is created by applying one
624 or more manufacturing process steps to a workpiece.

625 ***Persistence***

626 A method for retaining or restoring information.

627 ***Probe***

628 An instrument commonly used for measuring the physical geometrical characteris-
629 tics of an object.

630 ***Probe Request***

631 A *Probe Request* is a *Request* to an *Agent* to produce an *MTCConnectDevices Re-*
632 *sponse Document* containing the *Devices Information Model*.

633 ***Protocol***

634 A set of rules that allow two or more entities to transmit information from one to the
635 other.

636 ***Publish/Subscribe***

637 In the MTCConnect Standard, a communications messaging pattern that may be used
638 to publish *Streaming Data* from an *Agent*. When a *Publish/Subscribe* communi-
639 cation method is established between a client software application and an *Agent*,

640 the *Agent* will repeatedly publish a specific `MTCConnectStreams` document at a
641 defined period.

642 Appears in the documents in the following form: *Publish/Subscribe*.

643 ***Query***

644 General Meaning:

645 A portion of a request for information that more precisely defines the specific infor-
646 mation to be published in response to the request.

647 Appears in the documents in the following form: *Query*.

648 Used in an *HTTP Request Line*:

649 The form `query` includes a string of parameters that define filters used to refine the
650 content of a *Response Document* published in response to an *HTTP Request*.

651 Appears in the documents in the following form: `query`.

652 ***raw material***

653 Crude or processed material that can be converted by manufacture, processing, or
654 combination into a new and useful product.

655 ***Reference***

656 *Reference* is a pointer to information that is associated with another *Structural Ele-*
657 *ment*.

658 ***Request***

659 A communications method where a client software application transmits a message
660 to an *Agent*. That message instructs the *Agent* to respond with specific information.

661 Appears in the documents in the following form: *Request*.

662 ***Request/Response***

663 A communications pattern that supports the transfer of information between an
664 *Agent* and a client software application. In a *Request/Response* information ex-
665 change, a client software application requests specific information from an *Agent*.
666 An *Agent* responds to the *Request* by publishing a *Response Document*.

667 Appears in the documents in the following form: *Request/Response*.

668 ***Requester***

669 An entity that initiates a *Request* for information in a communications exchange.

670 Appears in the documents in the following form: *Requester*.

671 **reset**

672 A reset is associated with an occurrence of a *Data Entity* indicated by the `reset-`
 673 `Triggered` attribute. When a reset occurs, the accumulated value or statistic are
 674 reverted back to their initial value. A *Data Entity* with a *Data Set* representation
 675 removes all *key-value pairs*, setting the *Data Set* to an empty set.

676 **Responder**

677 An entity that responds to a *Request* for information in a communications exchange.
 678 Appears in the documents in the following form: *Responder*.

679 **Response Document**

680 An electronic document published by an *MTConnect Agent* in response to a *Probe*
 681 *Request*, *Current Request*, *Sample Request* or *Asset Request*.

682 **Root Element**

683 The first *Structural Element* provided in a *Response Document* encoded using XML.
 684 The *Root Element* is an XML container and is the *Parent Element* for all other XML
 685 elements in the document. The *Root Element* appears immediately following the
 686 XML Declaration.

687 Appears in the documents in the following form: *Root Element*.

688 **Sample**

689 General meaning:

690 The collection of one or more pieces of information.

691 Used when referring to the collection of information:

692 When referring to the collection of a piece of information from a data source.

693 Appears in the documents in the following form: `sample`.

694 Used as an *MTConnect Request*:

695 When representing a specific type of communications request between a client soft-
 696 ware application and an *Agent* regarding *Streaming Data*.

697 Appears in the documents in the following form: *Sample Request*.

698 Used as part of an *HTTP Request*:

699 Used in the `path` portion of an *HTTP Request Line*, by a client software applica-
 700 tion, to initiate a *Sample Request* to an *Agent* to publish an `MTConnectStreams`
 701 document.

702 Appears in the documents in the following form: `sample`.

703 Used to describe a *Data Entity*:

704 Used to define a specific type of *Data Entity*. A *Sample* type *Data Entity* reports the
705 value for a continuously variable or analog piece of information.

706 Appears in the documents in the following form: *Sample* or *Samples*.

707 Used as an XML container or element:

708 • When used as an XML container that consists of one or more types of *Sample*
709 XML elements.

710 Appears in the documents in the following form: *Samples*.

711 • When used as an abstract XML element. It is replaced in the XML document
712 by types of *Sample* elements representing individual *Sample* type of *Data*
713 *Entity*.

714 Appears in the documents in the following form: *Sample*.

715 ***Sample Request***

716 A *Sample Request* is a *Request* to an *Agent* to produce an *MTConnectStreams Re-*
717 *sponse Document* containing the *Observations Information Model* for a set of time-
718 stamped *observations* made by *Components*.

719 ***schema***

720 General meaning:

721 The definition of the structure, rules, and vocabularies used to define the information
722 published in an electronic document.

723 Appears in the documents in the following form: *schema*.

724 Used in association with an *MTConnect Response Document*:

725 Identifies a specific schema defined for an *MTConnect Response Document*.

726 Appears in the documents in the following form: *schema*.

727 ***semantic data model***

728 A methodology for defining the structure and meaning for data in a specific logical
729 way.

730 It provides the rules for encoding electronic information such that it can be inter-
731 preted by a software system.

732 Appears in the documents in the following form: *semantic data model*.

733 ***sensing element***

734 A mechanism that provides a signal or measured value.

735 **Sensor**

736 A *sensing element* that responds to a physical stimulus and transmits a resulting
737 signal.

738 **Sensor Configuration**

739 Data in the *MTCConnectDevices Response Document* that provides the information
740 required for maintenance and support of the *sensor unit*.

741 **Sensor Data**

742 The value of a physical quantity reported by a measuring instrument or controller as
743 an *observation*.

744 **sensor element**

745 A *sensor element* provides a signal or measured value.

746 **sensor unit**

747 An intelligent piece of equipment that manages the signals of one or more *sensing*
748 *elements* and provides the measured values.

749 **sequence number**

750 The primary key identifier used to manage and locate a specific piece of *Streaming*
751 *Data* in an *Agent*.

752 *sequence number* is a monotonically increasing number within an instance of an
753 *Agent*.

754 Appears in the documents in the following form: *sequence number*.

755 **specification limits**

756 A set of limits defining a range of values designating acceptable performance for a
757 variable.

758 **Spindle**

759 A mechanism that provides rotational capabilities to a piece of equipment.

760 Typically used for either work holding, materials or cutting tools.

761 **Standard**

762 General meaning:

763 A document established by consensus that provides rules, guidelines, or character-
764 istics for activities or their results (as defined in ISO/IEC Guide 2:2004).

765 Used when referring to the MTCConnect Standard:

766 The MTConnect Standard is a standard that provides the definition and semantic
767 data structure for information published by pieces of equipment.

768 Appears in the documents in the following form: Standard or MTConnect Standard.

769 ***Streaming Data***

770 The values published by a piece of equipment for the *Data Entities* defined by the
771 *Equipment Metadata*.

772 Appears in the documents in the following form: *Streaming Data*.

773 ***Streams Information Model***

774 The rules and terminology (*semantic data model*) that describes the *Streaming Data*
775 returned by an *Agent* from a piece of equipment in response to a *Sample Request* or
776 a *Current Request*.

777 Appears in the documents in the following form: *Streams Information Model*.

778 ***Structural Element***

779 General meaning:

780 An XML element that organizes information that represents the physical and logical
781 parts and sub-parts of a piece of equipment.

782 Appears in the documents in the following form: *Structural Element*.

783 Used to indicate hierarchy of Components:

784 When used to describe a primary physical or logical construct within a piece of
785 equipment.

786 Appears in the documents in the following form: *Top Level Structural Element*.

787 When used to indicate a *Child Element* which provides additional detail describing
788 the physical or logical structure of a *Top Level Structural Element*.

789 Appears in the documents in the following form: *Lower Level Structural Element*.

790 ***subtype***

791 General meaning:

792 A secondary or subordinate type of categorization or classification of information.

793 In software and data modeling, a subtype is a type of data that is related to another
794 higher-level type of data.

795 Appears in the documents in the following form: subtype.

796 Used as an attribute for a *Data Entity*:

797 Used as an attribute that provides a sub-categorization for the type attribute for a
798 piece of information.

799 Appears in the documents in the following form: subType.

800 **Table**

801 A two dimensional set of values given by a set of *key-value pairs Table Entries*.
802 Each *Table Entry* contains a set of *key-value pairs* of *Table Cells*. The `Entry` and
803 `Cell` elements comprise a tabular representation of the information.

804 **Table Cell**

805 A subdivision of a *Table Entry* representing a singular value.

806 **Table Entry**

807 A subdivision of a *Table* containing a set of *key-value pairs* representing *Table Cells*.

808 **time stamp**

809 General meaning:

810 The best available estimate of the time that the value(s) for published or recorded
811 information was measured or determined.

812 Appears in the documents as "time stamp".

813 Used as an attribute for recorded or published data:

814 An attribute that identifies the time associated with a *Data Entity* as stored in an
815 *Agent*.

816 Appears in the documents in the following form: `timestamp`.

817 **Top Level**

818 *Structural Elements* that represent the most significant physical or logical functions
819 of a piece of equipment.

820 **type**

821 General meaning:

822 A classification or categorization of information.

823 In software and data modeling, a type is a grouping function to identify pieces of
824 information that share common characteristics.

825 Appears in the documents in the following form: `type`.

826 Used as an attribute for a *Data Entity*:

827 Used as an attribute that provides a categorization for piece of information that share
828 common characteristics.

829 Appears in the documents in the following form: `type`.

830 ***upper limit***

831 The upper conformance boundary for a variable.

832 Note: immediate concern or action may be required.

833 ***upper warning***

834 The upper boundary indicating increased concern and supervision may be required.

835 ***Valid Data Value***

836 One or more acceptable values or constrained values that can be reported for a *Data*
837 *Entity*.

838 Appears in the documents in the following form: *Valid Data Value(s)*.

839 **WARNING**

840 General Meaning:

841 A statement or action that indicates a possible danger, problem, or other unexpected
842 situation.

843 Used relative to changes in an *MTConnect Document*:

844 Used to indicate that specific content in an *MTConnect Document* may be changed
845 in a future release of the standard.

846 Appears in the documents in the following form: **WARNING** .

847 Used as a *Valid Data Value* for a *Condition*:

848 Used as a *Valid Data Value* for a *Condition* type *Data Entity*.

849 Appears in the documents in the following form: WARNING.

850 Used as an *Element Name* for a *Data Entity*:

851 Used as the *Element Name* for a *Condition* type *Data Entity* in an *MTConnect-*
852 *Streams Response Document*.

853 Appears in the documents in the following form: Warning.

854 ***XML Container***

855 In the MTConnect Standard, a type of XML element.

856 An XML container is used to organize other XML elements that are logically related
857 to each other. A container may have either *Data Entities* or other *Structural Elements*
858 as *Child Elements*.

859 XML Document

860 An XML document is a structured text file encoded using XML.

861 An XML document is an instantiation of an XML schema. It has a single root XML
862 element, conforms to the XML specification, and is structured based upon a specific
863 schema.

864 *MTConnect Response Documents* may be encoded as an XML document.

865 XML Schema

866 In the MTConnect Standard, an instantiation of a schema defining a specific docu-
867 ment encoded in XML.

868 3.2 MTConnect References

869 [MTConnect Part 1.0] *MTConnect Standard Part 1.0 - Overview and Fundamentals*. Ver-
870 sion 1.8.0.

871 [MTConnect Part 2.0] *MTConnect Standard: Part 2.0 - Devices Information Model*. Ver-
872 sion 1.8.0.

873 [MTConnect Part 3.0] *MTConnect Standard: Part 3.0 - Streams Information Model*. Ver-
874 sion 1.8.0.

875 [MTConnect Part 4.0] *MTConnect Standard: Part 4.0 - Assets Information Model*. Ver-
876 sion 1.8.0.

877 [MTConnect Part 5.0] *MTConnect Standard: Part 5.0 - Interfaces*. Version 1.8.0.

878 4 MTConnect Standard

879 The MTConnect Standard is organized in a series of documents (also referred to as MT-
880 Connect Documents) that each address a specific set of requirements defined by the Stan-
881 dard. Each MTConnect Document will be referred to as a Part of the Standard; e.g.,
882 *MTConnect Standard Part 1.0 - Overview and Fundamentals*. Together, these documents
883 describe the *Base Functional Structure* specified in the MTConnect Standard.

884 Implementation of any manufacturing data management system may utilize information
885 from any number of these documents. However, it is not necessary to realize all informa-
886 tion contained in these documents for any one specific implementation.

887 4.1 MTConnect Documents Organization

888 The MTConnect specification is organized into the following documents:

889 *MTConnect Standard Part 1.0 - Overview and Fundamentals*: Provides an overview of
890 the MTConnect Standard and defines the terminology and structure used throughout all
891 documents associated with the Standard. Additionally, [MTConnect Part 1.0] describes
892 the functions provided by an *Agent* and the protocol used to communicate with an *Agent*.

893 *MTConnect Standard: Part 2.0 - Devices Information Model*: Defines the *semantic data*
894 *model* that describes the data that can be supplied by a piece of equipment. This model
895 details the XML elements used to describe the structural and logical configuration for a
896 piece of equipment. It also describes each type of data that may be supplied by a piece of
897 equipment in a manufacturing operation.

898 *MTConnect Standard: Part 3.0 - Streams Information Model*: Defines the *semantic data*
899 *model* that organizes the data that is collected from a piece of equipment and transferred
900 to a client software application from an *Agent*.

901 *MTConnect Standard: Part 4.0 - Assets Information Model*: Provides an overview of *MT-*
902 *Connect Assets* and the functions provided by an *Agent* to communicate information relat-
903 ing to *Assets*. The various *semantic data models* describing each type of *MTConnect Asset*
904 are defined in sub-Part documents (Part 4.x) of the MTConnect Standard.

905 *MTConnect Standard: Part 5.0 - Interfaces*: Defines the MTConnect implementation of
906 the *Interaction Model* used to coordinate actions between pieces of equipment used in
907 manufacturing systems.

908 4.2 MTConnect Document Versioning

909 The MTConnect Standard will be periodically updated with new and expanded function-
910 ality. Each new release of the Standard will include additional content adding new func-
911 tionality and/or extensions to the *semantic data models* defined in the Standard.

912 The MTConnect Standard uses a three-digit version numbering system to identify each
913 release of the Standard that indicates the progression of enhancements to the Standard. The
914 format used to identify the documents in a specific version of the MTConnect Standard is:

915 *major.minor.revision*

916 *major* – Identifier representing a consistent set of functionalities defined by the MTCon-
917 nect Standard. This functionality includes the protocol(s) used to communicate data to a
918 client software application, the *semantic data models* defining how that data is organized
919 into *Response Documents*, and the encoding of those *Response Documents*. This set of
920 functionalities is referred to as the *Base Functional Structure*.

921 When a release of the MTConnect Standard removes or modifies any of the protocol(s),
922 *semantic data models*, or encoding of the *Response Documents* included in the *Base Func-*
923 *tional Structure* in such a way that it breaks backward compatibility and a client software
924 application can no longer communicate with an *Agent* or cannot interpret the information
925 provided by an *Agent*, the *major* version identifier for the Documents in the release is
926 revised to a successively higher number.

927 See *Section 4.5 - Backwards Compatibility* for details regarding the interaction between a
928 client software application and versions of the MTConnect Standard.

929 *minor* – Identifier representing a specific set of functionalities defined by the MTConnect
930 Standard. Each release of the Standard (with a common *major* version identifier) includes
931 new and/or expanded functionality – protocol extensions, new or extended *semantic data*
932 *models*, and/or new programming languages. Each of these releases of the Standard is
933 indicated by a successively higher *minor* version identifier.

934 If a new *major* version of the MTConnect Standard is released, the *minor* version identifier
935 will be reset to 0.

936 *revision* – A supplemental identifier representing only organizational or editorial changes
937 to a *minor* version document with no changes in the functionality described in that docu-
938 ment.

939 New releases of a specific document are indicated by a successively higher revision version
940 identifier.

941 If a new *minor* version of a document is released, the *revision* identifier will be reset to 0.

942 An example of the version identifier for a specific document would be:

Version M.N.R

943 **4.2.1 Document Releases**

944 A *major* revision change represents a substantial change to the MTConnect Standard. At
945 the time of a *major* revision change, all documents representing the MTConnect Standard
946 will be updated and released together.

947 A *minor* revision change represents some level of extended functionality supported by the
948 MTConnect Standard. At the time of a *minor* version release, MTConnect Documents
949 representing the changes or enhancements to the Standard will be updated as required.
950 However, all documents, whether updated or not, will be released together with a new
951 *minor* version number. Providing all documents at a common *major* and *minor* version
952 makes it easier for implementers to manage the compatibility and upgrade of the different
953 software tools incorporated into a manufacturing software system.

954 Since a *revision* represents no functional changes to the MTConnect Standard and includes
955 only editorial or descriptive changes that enhance the understanding of the functionality
956 supported by the Standard, individual documents within the Standard may be released
957 at any time with a new *revision* and that release does not impact any other documents
958 associated with the MTConnect Standard.

959 The latest released version of each document provided for the MTConnect Standard, and
960 historical releases of those documents, are provided at <http://www.mtconnect.org>.

961 4.3 MTConnect Document Naming Conventions

962 MTConnect Documents are identified as follows:

963 4.3.1 Document Title

964 Each MTConnect Document **MUST** be identified as follows:

MTConnect® Standard

Part #.# - *Title*

Version M.N.R.

965 The following keys are used to distinguish different Parts of the MTConnect Standard and
966 the version of the MTConnect Document:

967 #.# – Identifier of the specific Part and sub-Part of the MTConnect Standard

968 Title – Description of the type of information contained in the MTConnect Document

969 M – Indicator of the *major* version of the MTConnect Document

970 N– Indicator of the *minor* version of the MTConnect Document

971 R – Indicator of the revision of the MTConnect Document

972 For example, a release of *MTConnect Standard: Part 2.0 - Devices Information Model*
973 would be:

MTConnect® Standard

Part 2.0 - *Devices Information Model*

Version 1.2.0

974 4.3.2 Electronic Document File Naming

975 Electronic versions of the MTConnect Documents will be provided in PDF format and
976 follow this naming convention:

977 MTC_Part#-#_Title_M-N-R.pdf

978 The electronic version of the same release of *MTCConnect Standard: Part 2.0 - Devices*
979 *Information Model* would be:

980 MTC_Part_2-0_Devices_Information_Model_1-2-0.pdf

981 **4.4 Document Conventions**

982 Additional information regarding specific content in the MTCConnect Standard is provided
983 in the sections below.

984 **4.4.1 Use of MUST, SHOULD, and MAY**

985 These words convey specific meaning in the MTCConnect Standard when presented in cap-
986 ital letters, Times New Roman font, and a Bold font style.

- 987 • The word **MUST** indicates content that is mandatory to be provided in an imple-
988 mentation where indicated.
- 989 • The word **SHOULD** indicates content that is recommended, but the exclusion of
990 which will not invalidate an implementation.
- 991 • The word **MAY** indicates content that is optional. It is up to the implementer to
992 decide if the content is relevant to an implementation.
- 993 • The word **NOT** may be added to the words **MUST** or **SHOULD** to negate the re-
994 quirement.

995 **4.4.2 Text Conventions**

996 The following conventions will be used throughout the MTCConnect Documents to provide
997 a clear and consistent understanding of the use of each type of information used to define
998 the MTCConnect Standard.

999 These conventions are:

- 1000 • Standard text is provided in Times New Roman font.

- 1001 • References to documents, sections or sub-sections of a document, or figures within a
1002 document are *italicized*; e.g., *MTConnect Standard: Part 2.0 - Devices Information*
1003 *Model*.
- 1004 • Terms with a specific meaning in the MTConnect Standard will be *italicized*; e.g.,
1005 *major* indicating a version of the Standard.
- 1006 • When these same terms are used within the text without specific reference to their
1007 function within the MTConnect Standard, they will be provided as non-italicized
1008 font; e.g., *major* indicating a descriptor of another term.
- 1009 • Terms representing content of an MTConnect *semantic data model* or the protocol
1010 used in MTConnect will be provided in fixed size, Courier New font; e.g., `compo-`
1011 `nent`, `probe`, `current`.
- 1012 When these same terms are used within the text without specific reference to
1013 their function within the MTConnect Standard, they will be provided as Times New
1014 Roman font.
- 1015 • All *Valid Data Values* that are restricted to a limited or controlled vocabulary will be
1016 provided in upper case Courier New font with an `_`(underscore) separating words.
1017 For example: `ON`, `OFF`, `ACTUAL`, `COUNTER_CLOCKWISE`, etc.
- 1018 • All descriptive attributes associated with each piece of data defined in a *Response*
1019 *Document* will be provided in Courier New font and camel case font style. For
1020 example: `nativeUnits`.

1021 4.4.3 Code Line Syntax and Conventions

1022 The following conventions will be used throughout the MTConnect Documents to describe
1023 examples of software code produced by an *Agent* or commands provided to an *Agent* from
1024 a client software application.

1025 All examples are provided in fixed size Courier New font with line numbers.

1026 These conventions are:

- 1027 • XML Code examples:

Example 1: XML Code Examples

```

1028 1 <MTConnectStreams xmlns:m="urn:mtconnect.com:
1029 2   MTConnectStreams:1.1" xmlns:xsi=
1030 3   "http://www.w3.org/2001/XMLSchema-instance"
1031 4   xmlns="urn:mtconnect.com:MTConnectStreams:1.1"

```

- 1032 • HTTP URL examples:
- 1033 – http://<authority>/<path>[?<query>]When a portion of a URL is enclosed in
1034 angle brackets (" $<$ " and " $>$ "), that section of the URL is a place holder for
1035 specific information that will replace the term between the angle brackets.
- 1036 Note: The angle brackets in a URL do not relate to the angle brackets
1037 used as the `tag` elements in an XML example.
- 1038 – A portion of a URL that is enclosed in square brackets "[" and "]" indicates
1039 that the enclosed content is optional.
- 1040 – All other characters in the URL are literal.

1041 4.4.4 Semantic Data Model Content

1042 For each of the *semantic data models* defined in the MTConnect Standard, there are tables
1043 describing pieces of information provided in the data models. Each table has a column
1044 labeled *Occurrence*. *Occurrence* defines the number of times the content defined in the
1045 tables **MAY** be provided in the usage case specified.

- 1046 • If the *Occurrence* is 1, the content **MUST** be provided.
- 1047 • If the *Occurrence* is 0..1, the content **MAY** be provided and if provided, at most,
1048 only one occurrence of the content **MUST** be provided.
- 1049 • If the *Occurrence* is 0..*, the content **MAY** be provided and any number of occur-
1050 rences of the content **MAY** be provided.
- 1051 • If the *Occurrence* is 1..*, one or more occurrences of the content **MUST** be pro-
1052 vided.
- 1053 • If the *Occurrence* is a number, e.g., 2, exactly that number of occurrences of the
1054 content **MUST** be provided.

1055 Note: "*" indicates multiple number of occurrences and is represented by ∞ in the
1056 figures.

1057 4.4.5 Referenced Standards and Specifications

1058 Other standards and specifications may be used to describe aspects of the protocol, *data*
1059 *dictionary*, or *semantic data models* defined in the MTConnect Standard. When a spe-

1060 cific standard or specification is referenced in the MTConnect Standard, the name of the
1061 standard or specification will be provided in *italicized* font.

1062 See *Section 3 - Terminology and Conventions: Bibliography* for a complete listing of
1063 standards and specifications used or referenced in the MTConnect Standard.

1064 **4.4.6 Deprecation and Deprecation Warnings**

1065 When the MTConnect Institute adds new functionality to the MTConnect Standard, the
1066 new content may supersede some of the functionality of existing content or significantly
1067 enhance one of the *semantic data models*. When this occurs, existing content may no
1068 longer be valid for use in the new version of the Standard.

1069 **4.4.6.1 Deprecation**

1070 In cases when new content supersedes the functionality of the existing content, the original
1071 content **MUST** no longer be included in future implementations – only the new content
1072 should be used.

1073 The superseded content is identified by striking through the original content (~~original
1074 content~~) and marking the content with the words "**DEPRECATED** in *Version M.N*".

1075 The deprecated content must remain in all future *minor* versions of the document. The
1076 content may be removed when a *major* version update is released. This provides imple-
1077 menter's guidance on how to interpret data that may be provided from equipment utilizing
1078 an older version of the Standard. This content provides the information required for imple-
1079 menter's to develop software applications that support backwards compatibility with older
1080 versions of the standard.

1081 A software application may be designed to be compliant with any specific *minor* version
1082 of the standard. That software application may be collecting data from many different
1083 pieces of equipment. Each of these pieces of equipment may be providing data defined
1084 by the current version or any of the previous *minor* versions of the standard. To maintain
1085 compatibility with existing pieces of equipment, software applications should be imple-
1086 mented to interpret data defined in the current release of the MTConnect Standard, as well
1087 as all deprecated content associated with earlier versions of the Standard.

1088 **4.4.6.2 Deprecation Warning**

1089 When new content provides improved alternatives for defining the *semantic data mod-*

1090 *els*, the MTConnect Institute may determine that the original content could possibly be
1091 deprecated in the future. When this occurs, a content will be marked with the words
1092 "**DEPRECATION WARNING** " to identify the content that may be deprecated in the
1093 future. This provides advanced notice to implementers that they should choose to utilize
1094 the improved alternatives when developing new products or software systems to avoid the
1095 possibility that the original content may be deprecated in a future version of the Standard.

1096 4.5 Backwards Compatibility

1097 MTConnect Documents with a different *major* version identifier represent a significant
1098 change in the *Base Functional Structure* of the MTConnect Standard. This means that
1099 the schema or protocol defined by the Standard may have changed in ways that will re-
1100 quire software applications to change how they request and/or interpret data received from
1101 an *Agent*. Software applications should be fully version aware since no assumption of
1102 backwards compatibility should be assumed at the time of a *major* revision change to the
1103 MTConnect Standard.

1104 The MTConnect Institute strives to maintain version compatibility through all *minor* re-
1105 visions of the MTConnect Standard. New *minor* versions may introduce extensions to
1106 existing *semantic data models*, extend the protocol used to communicate to the *Agent*,
1107 and/or add new *semantic data models* to extend the functionality of the Standard. Client
1108 software applications may be designed to be compliant with any specific *minor* version
1109 of the MTConnect Standard. Additionally, software applications should be capable of in-
1110 terpreting information from an *Agent* providing data based upon a lower *minor* version
1111 identifier. It should also be capable of interpreting information from an *Agent* providing
1112 data based upon a higher *minor* version identifier of the MTConnect Standard than the
1113 version supported by the client, even though the client may ignore or not be capable of
1114 interpreting the extended content provided by the *Agent*.

1115 A *revision* version of any MTConnect Document provides only editorial changes requiring
1116 no changes to an *Agent* or a client application.

1117 5 MTConnect Fundamentals

1118 The MTConnect Standard defines the functionality of an *Agent*. In an MTConnect instal-
 1119 lation, pieces of equipment publish information to an *Agent*. Client software applications
 1120 request information from the *Agent* using a communications protocol. Based on the spe-
 1121 cific information that the client software application has requested from the *Agent*, the
 1122 *Agent* forms a *Response Document* based upon one of the *semantic data models* defined
 1123 in the MTConnect Standard and then transmits that document to the client software appli-
 1124 cation.

1125 *Figure 2* illustrates the architecture of a typical MTConnect installation.

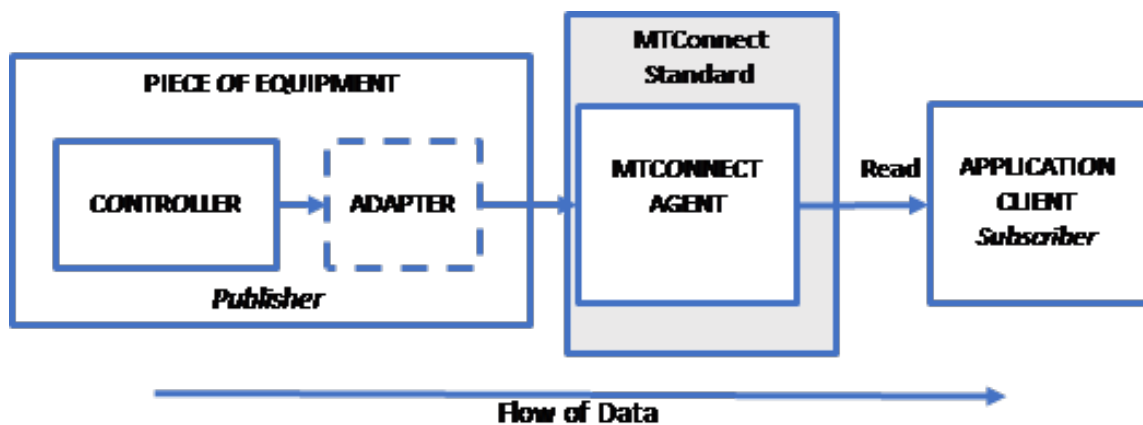

Figure 2: MTConnect Architecture Model

1126 Note: In each implementation of a communication system based on the MTConnect
 1127 Standard, there **MUST** be a schema defined that encodes the rules and termi-
 1128 nology defined for each of the *semantic data models*. These schemas **MAY** be
 1129 used by client software applications to validate the content and structure of the
 1130 *Response Documents* published by an *Agent*.

1131 5.1 Agent

1132 An *Agent* is the centerpiece of an MTConnect implementation. It provides two primary
 1133 functions:

- 1134 • Organizes and manages individual pieces of information published by one or more
 1135 pieces of equipment.

- 1136 • Publishes that information in the form of a *Response Document* to client software
1137 applications.

1138 The MTConnect Standard addresses the behavior of an *Agent* and the structure and mean-
1139 ing of the data published by an *Agent*. It is the responsibility of the implementer of an
1140 *Agent* to determine the means by which the behavior is achieved for a specific *Agent*.

1141 An *Agent* is software that may be installed as part of a piece of equipment or it may be
1142 installed separately. When installed separately, an *Agent* may receive information from
1143 one or more pieces of equipment.

1144 Some pieces of equipment may be able to communicate directly to an *Agent*. Other pieces
1145 of equipment may require an *Adapter* to transform the information provided by the equip-
1146 ment into a form that can be sent to an *Agent*. In either case, the method of transmitting
1147 information from the piece of equipment to an *Agent* is implementation dependent and is
1148 not addressed as part of the MTConnect Standard.

1149 One function of an *Agent* is to store information that it receives from a piece of equipment
1150 in an organized manner. A second function of an *Agent* is to receive *Requests* for informa-
1151 tion from one or many client software applications and then respond to those *Requests* by
1152 publishing a *Response Document* that contains the requested information.

1153 There are three types of information stored by an *Agent* that **MAY** be published in a *Re-*
1154 *sponse Document*. These are:

1155 • *Equipment Metadata* defines the *Structural Elements* that represent the physical and
1156 logical parts and sub-parts of each piece of equipment that can publish data to the
1157 *Agent*, the relationships between those parts and sub-parts, and the *Data Entities*
1158 associated with each of those *Structural Elements*. This *Equipment Metadata* is
1159 provided in an *MTConnectDevices Response Document*. See *MTConnect Standard:*
1160 *Part 2.0 - Devices Information Model* for more information on *Equipment Metadata*.

1161 • *Streaming Data* provides the values published by pieces of equipment for the *Data*
1162 *Entities* defined by the *Equipment Metadata*. *Streaming Data* is provided in an *MT-*
1163 *ConnectStreams Response Document*. See *MTConnect Standard: Part 2.0 - Devices*
1164 *Information Model* for more information on *Streaming Data*.

1165 • *MTConnect Assets* represent information used in a manufacturing operation that is
1166 commonly shared amongst multiple pieces of equipment and/or software applica-
1167 tions. *MTConnect Assets* are provided in an *MTConnectAssets Response Document*.
1168 See *MTConnect Standard: Part 4.0 - Assets Information Model* for more informa-
1169 tion on *MTConnect Assets*.

1170 The exchange between an *Agent* and a client software application is a *Request* and *Re-*
1171 *sponse* information exchange mechanism. See *Section 5.4 - Request/Response Information*
1172 *Exchange* for details on this *Request/Response* information exchange mechanism.

1173 5.1.1 Instance of an Agent

1174 As described above, an *Agent* collects and organizes values published by pieces of equip-
1175 ment. As with any piece of software, an *Agent* may be periodically restarted. When an
1176 *Agent* restarts, it **MUST** indicate to client software applications whether the information
1177 available in the *buffer* represents a completely new set of data or if the *buffer* includes data
1178 that had been collected prior to the restart of the *Agent*.

1179 Any time an *Agent* is restarted and begins to collect a completely new set of *Streaming*
1180 *Data*, that set of data is referred to as an *instance* of the *Agent*. The *Agent* **MUST** maintain
1181 a piece of information called `instanceId` that represents the specific *instance* of the
1182 *Agent*.

1183 `instanceId` is represented by a 64-bit integer. The `instanceId` **MAY** be imple-
1184 mented using any mechanism that will guarantee that the value for `instanceId` will be
1185 unique each time the *Agent* begins collecting a new set of data.

1186 When an *Agent* is restarted and it provides a method to recover all, or some portion, of
1187 the data that was stored in the *buffer* before it stopped operating, the *Agent* **MUST** use the
1188 same `instanceId` that was defined prior to the restart.

1189 5.1.2 Storage of Equipment Metadata for a Piece of Equipment

1190 An *Agent* **MUST** be capable of publishing *Equipment Metadata* for each piece of equip-
1191 ment that publishes information through the *Agent*. *Equipment Metadata* is typically a
1192 static file defining the *Structural Elements* associated with each piece of equipment re-
1193 porting information through the *Agent* and the *Data Entities* that can be associated with
1194 each of these *Structural Elements*. See details on *Structural Elements* and *Data Entities* in
1195 *MTConnect Standard: Part 2.0 - Devices Information Model*.

1196 The MTConnect Standard does not define the mechanism to be used by an *Agent* to ac-
1197 quire, maintain, or store the *Equipment Metadata*. This mechanism **MUST** be defined as
1198 part of the implementation of a specific *Agent*.

1199 5.1.3 Storage of Streaming Data

1200 *Streaming Data* that is published from a piece(s) of equipment to an *Agent* is stored by the
 1201 *Agent* based upon the sequence upon which each piece of data is received. As described
 1202 below, the order in which data is stored by the *Agent* is one of the factors that determines
 1203 the data that may be included in a specific *MTConnectStreams Response Document*.

1204 5.1.3.1 Management of Streaming Data Storage

1205 An *Agent* stores a fixed amount of data. The amount of data stored by an *Agent* is depen-
 1206 dent upon the implementation of a specific *Agent*. The examples below demonstrate how
 1207 discrete pieces of data received from pieces of equipment are stored.

1208 The method for storing *Streaming Data* in an *Agent* can be thought of as a tube that can
 1209 hold a finite set of balls. Each ball represents the occurrence of a *Data Entity* published
 1210 by a piece of equipment. This data is pushed in one end of the tube until there is no more
 1211 room for additional balls. At that point, any new data inserted will push the oldest data out
 1212 the back of the tube. The data in the tube will continue to shift in this manner as new data
 1213 is received.

1214 This tube is referred to as a *buffer* in an *Agent*.

Figure 3: Data Storage in Buffer

1215 In *Figure 4*, the maximum number of *Data Entities* that can be stored in the *buffer* of
 1216 the *Agent* is 8. The maximum number of *Data Entities* that can be stored in the *buffer* is
 1217 represented by a value called `bufferSize`. This example illustrates that when the *buffer*
 1218 fills up, the oldest piece of data falls out the other end.

Figure 4: First In First Out Buffer Management

1219 This process constrains the memory storage requirements for an *Agent* to a fixed maximum
1220 size since the MTConnect Standard only requires an *Agent* to store a finite number of
1221 pieces of data.

1222 As an implementation guideline, the *buffer* **SHOULD** be sized large enough to provide
1223 storage for a reasonable amount of information received from all pieces of equipment
1224 that are publishing information to that *Agent*. The implementer should also consider the
1225 impact of a temporary loss of communications between a client software application and
1226 an *Agent* when determining the size for the *buffer*. A larger *buffer* will allow a client
1227 software application more time to reconnect to an *Agent* without losing data.

1228 **5.1.3.2 Sequence Numbers**

1229 In an *Agent*, each occurrence of a *Data Entity* in the *buffer* will be assigned a monotonically
1230 increasing *sequence number* as it is inserted into the *buffer*. The *sequence number*
1231 is a 64-bit integer and the values assigned as *sequence numbers* will never wrap around or
1232 be exhausted; at least within the next 100,000 years based on the size of a 64-bit number.

1233 *sequence number* is the primary key identifier used to manage and locate a specific piece
1234 of data in an *Agent*. The *sequence number* associated with each *Data Entity* reported by
1235 an *Agent* is identified with an attribute called `sequence`.

1236 The *sequence number* for each piece of data **MUST** be unique for an instance of an *Agent*
1237 (see *Section 5.1.1 - Instance of an Agent* for information on *instances* of an *Agent*). If data
1238 is received from more than one piece of equipment, the *sequence numbers* are based on
1239 the order in which the data is received regardless of which piece of equipment produced
1240 that data. The *sequence number* **MUST** be a monotonically increasing number that spans
1241 all pieces of equipment publishing data to an *Agent*. This allows for multiple pieces of
1242 equipment to publish data through a single *Agent* with no *sequence number* collisions and
1243 unnecessary protocol complexity.

1244 The *sequence number* **MUST** be reset to one (1) each time an *Agent* is restarted and begins
1245 to collect a fresh set of data; i.e., each time `instanceId` is changed.

1246 *Figure 5* demonstrates the relationship between `instanceId` and `sequence` when an
1247 *Agent* stops and restarts and begins collecting a new set of data. In this case, the `in-`
1248 `stanceId` is changed to a new value and value for `sequence` resets to one (1):

| instanceId | sequence |
|-------------------|-----------------|
| 234556 | 234 |
| | 235 |
| | 236 |
| | 237 |
| | 238 |

Agent Stops and Restarts

| | |
|---------------|----------|
| 234557 | 1 |
| | 2 |
| | 3 |
| | 4 |
| | 5 |

Figure 5: instanceId and sequence

1249 *Figure 6* also shows two additional pieces of information defined for an *Agent*:

- 1250 • `firstSequence` – the oldest piece of data contained in the *buffer*; i.e., the next
- 1251 piece of data to be moved out of the *buffer*
- 1252 • `lastSequence` – the newest data added to the *buffer*

1253 `firstSequence` and `lastSequence` provide guidance to a software application iden-
 1254 tifying the range of data available that may be requested from an *Agent*.

Figure 6: Identifying the range of data with `firstSequence` and `lastSequence`

1255 When a client software application requests data from an *Agent*, it can specify both the
 1256 *sequence number* of the first piece of data (`from`) that **MUST** be included in the *Response*

1257 *Document* and the total number (*count*) of pieces of data that **SHOULD** be included in
 1258 that document.

1259 In *Figure 7*, the request specifies that the data to be returned starts at *sequence number 15*
 1260 (*from*) and includes a total of three items (*count*).

Figure 7: Identifying the range of data with `from` and `count`

1261 Once a *Response* to a *Request* has been completed, the value of `nextSequence` will be
 1262 established. `nextSequence` is the *sequence number* of the next piece of data available
 1263 in the *buffer*. In the example in *Figure 7*, the next *sequence number* (`nextSequence`)
 1264 will be 18.

1265 As shown in *Figure 8*, the combination of `from` and `count` defined by the *Request*
 1266 indicates a *sequence number* for data that is beyond that which is currently in the *buffer*.
 1267 In this case, `nextSequence` is set to a value of `lastSequence + 1`.

Figure 8: Identifying the range of data with nextSequence and lastSequence

1268 5.1.3.3 Buffer Data Structure

1269 The information in the *buffer* of an *Agent* can be thought of as a four-column table of data.
1270 Each column in the table represents:

- 1271 • The first column is the *sequence number* associated with each *Data Entity* - se-
1272 quence.
- 1273 • The second column is the time that the data was published by a piece of equip-
1274 ment. This time is defined as the `timestamp` associated with that *Data Entity*. See
1275 *Section 5.1.3.4 - Time Stamp* for details on `timestamp`.
- 1276 • The third column, `dataItemId`, refers to the identity of *Data Entities* as they will
1277 appear in the *MTCConnectStreams Response Document*. See *Section 5 of MTCConnect*
1278 *Standard: Part 3.0 - Streams Information Model* for details on `dataItemId` for
1279 a *Data Entity* and how that identify relates to the `id` attribute of the corresponding
1280 *Data Entity* in the *Devices Information Model*.
- 1281 • The fourth column is the value associated with each *Data Entity*.

1282 *Figure 9* is an example demonstrating the concept of how data may be stored in an *Agent*:

| AGENT | | | |
|--------------|---------------------------------|--------------------|--------------------|
| Seq | Time | dataItemId | Value |
| 101 | 2016-12-13T09:44:00.2221 | AVAIL-28277 | UNAVAILABLE |
| 102 | 2016-12-13T09:54:00.3839 | AVAIL-28277 | AVAILABLE |
| 103 | 2016-12-13T10:00:00.0594 | POS-Y-28277 | 25.348 |
| 104 | 2016-12-13T10:00:00.0594 | POS-Z-28277 | 13.23 |
| 105 | 2016-12-13T10:00:03.2839 | SS-28277 | 0 |
| 106 | 2016-12-13T10:00:03.2839 | POS-X-73746 | 11.195 |
| 107 | 2016-12-13T10:00:03.2839 | POS-Y-73746 | 24.938 |
| 108 | 2016-12-13T10:01:37.8594 | POS-Z-73746 | 1.143 |
| 109 | 2016-12-13T10:02:03.2617 | SS-28277 | 1002 |

Figure 9: Data Storage Concept

1283 The storage mechanism for the data, the internal representation of the data, and the imple-
 1284 mentation of the *Agent* itself is not part of the MTConnect Standard. The implementer can
 1285 choose both the amount of data to be stored in the *Agent* and the mechanism for how the
 1286 data is stored. The only requirement is that an *Agent* publish the *Response Documents* in
 1287 the required format.

1288 5.1.3.4 Time Stamp

1289 Each piece of equipment that publishes information to an *Agent* **SHOULD** provide a time
 1290 stamp indicating when each piece of information was measured or determined. If no time
 1291 stamp is provided, the *Agent* **MUST** provide a time stamp for the information based upon
 1292 when that information was received at the *Agent*.

1293 The `timestamp` associated with each piece of information is reported by an *Agent* as
 1294 `timestamp`. `timestamp` **MUST** be reported in UTC (Coordinated Universal Time)
 1295 format; e.g., "2010-04-01T21:22:43Z".

1296 Note: Z refers to UTC/GMT time, not local time.

1297 Client software applications should use the value of `timestamp` reported for each piece
 1298 of information as the means for ordering when pieces of information were generated as
 1299 opposed to using `sequence` for this purpose.

1300 Note: It is assumed that `timestamp` provides the best available estimate of the time
1301 that the value(s) for the published information was measured or determined.

1302 If two pieces of information are measured or determined at the exact same time, they
1303 **MUST** be reported with the same value for `timestamp`. Likewise, all information that
1304 is recorded in the *buffer* with the same value for `timestamp` should be interpreted as
1305 having been recorded at the same point in time; even if that data was published by more
1306 than one piece of equipment.

1307 **5.1.3.5 Recording Occurrences of Streaming Data**

1308 An *Agent* **MUST** record data in the *buffer* each time the value for that specific piece of data
1309 changes. If a piece of equipment publishes multiple occurrences of a piece of data with
1310 the same value, the *Agent* **MUST NOT** record multiple occurrence for that *Data Entity*.

1311 Note: There is one exception to this rule. Some *Data Entities* may be defined with a
1312 `representation` attribute value of `DISCRETE` (**DEPRECATED** in *Ver-*
1313 *sion 1.5*) (See *Section 7.2.2.12 of MTConnect Standard: Part 2.0 - Devices*
1314 *Information Model* for details on `representation`.) In this case, each oc-
1315 currence of the data represents a new and unique piece of information. The
1316 *Agent* **MUST** then record each occurrence of the *Data Entity* that is published
1317 by a piece of equipment.

1318 The value for each piece of information reported by an *Agent* must be considered by a
1319 client software application to be valid until such a time that another occurrence of that
1320 piece of information is published by the *Agent*.

1321 **5.1.3.6 Maintaining Last Value for Data Entities**

1322 An *Agent* **MUST** retain a copy of the last available value associated with each *Data Entity*
1323 known to the *Agent*; even if an occurrence of that *Data Entity* is no longer in the *buffer*.
1324 This function allows an *Agent* to provide a software application a view of the last known
1325 value for each *Data Entity* associated with a piece of equipment.

1326 The *Agent* **MUST** also retain a copy of the last value associated with each *Data Entity* that
1327 has flowed out of the *buffer*. This function allows an *Agent* to provide a software applica-
1328 tion a view of the last known value for each *Data Entity* associated with a *Current Request*
1329 with an `at` parameter in the `query` portion of its *HTTP Request Line* (See *Section 8.3.2 -*
1330 *Current Request Implemented Using HTTP* for details on *Current Request*).

1331 **5.1.3.7 Unavailability of Data**

1332 An *Agent* **MUST** maintain a list of *Data Entities* that **MAY** be published by each piece of
 1333 equipment providing information to the *Agent*. This list of *Data Entities* is derived from
 1334 the *Equipment Metadata* stored in the *Agent* for each piece of equipment.

1335 Each time an *Agent* is restarted, the *Agent* **MUST** place an occurrence of every *Data*
 1336 *Entity* in the *buffer*. The value reported for each of these *Data Entities* **MUST** be set to
 1337 UNAVAILABLE and the `timestamp` for each **MUST** be set to the time that the last piece
 1338 of data was collected by the *Agent* prior to the restart.

1339 If at any time an *Agent* loses communications with a piece of equipment, or the *Agent* is
 1340 unable to determine a valid value for all, or any portion, of the *Data Entities* published by
 1341 a piece of equipment, the *Agent* **MUST** place an occurrence of each of these *Data Entities*
 1342 in the *buffer* with its value set to UNAVAILABLE. This signifies that the value is currently
 1343 indeterminate and no assumptions of a valid value for the data is possible.

1344 Since an *Agent* may receive information from multiple pieces of equipment, it **MUST**
 1345 consider the validity of the data from each of these pieces of equipment independently.

1346 There is one exception to the rules above. Any *Data Entity* that is constrained to a constant
 1347 data value **MUST** be reported with the constant value and the *Agent* **MUST NOT** set the
 1348 value of that *Data Entity* to UNAVAILABLE.

1349 Note: The schema for the *Devices Information Model* (defined in *MTCConnect Stan-*
 1350 *dard: Part 2.0 - Devices Information Model*) defines how the value reported for
 1351 an individual piece of data may be constrained to one or more specific values.

1352 **5.1.3.8 Persistence and Recovery**

1353 The implementer of an *Agent* must decide on a strategy regarding the storage of *Streaming*
 1354 *Data* in the *buffer* of the *Agent*.

1355 In the simplest form, an *Agent* can hold the *buffer* information in volatile memory where
 1356 no data is persisted when the *Agent* is stopped. In this case, the *Agent* **MUST** update the
 1357 value for `instanceId` when the *Agent* restarts to indicate that the *Agent* has begun to
 1358 collect a new set of data.

1359 If the implementation of an *Agent* provides a method of persisting and restoring all or
 1360 a portion of the information in the *buffer* of the *Agent* (*sequence numbers, time stamps,*
 1361 *identify, and values*), the *Agent* **MUST NOT** change the value of the `instanceId` when
 1362 the *Agent* restarts. This will indicate to a client software application that it does not need to
 1363 reset the value for `nextSequence` when it requests the next set of data from the *Agent*.

1364 When an implementer chooses to provide a method to persist the information in an *Agent*,
1365 they may choose to store as much data as is practical in a recoverable storage system. Such
1366 a method may also include the ability to store historical information that has previously
1367 been pushed out of the *buffer*.

1368 **5.1.3.9 Heartbeat**

1369 An *Agent* **MUST** provide a function that indicates to a client application that the HTTP
1370 connection is still viable during times when there is no new data available to report in a
1371 *Response Document*. This function is defined as *heartbeat*.

1372 *heartbeat* represents the amount of time after a *Response Document* has been published
1373 until a new *Response Document* **MUST** be published, even when no new data is available.

1374 See *Section 8.3.3.2 - Query Portion of the HTTP Request Line for a Sample Request* for
1375 more details on configuring the *heartbeat* function.

1376 **5.1.3.10 Data Sets**

1377 See *MTConnect Standard: Part 3.0 - Streams Information Model Section Part 3: DataItem*
1378 *with representation of DATA_SET* for management of *Data Sets*.

1379 **5.1.4 Storage of Documents for MTConnect Assets**

1380 An *Agent* also stores information associated with *MTConnect Assets*.

1381 When a piece of equipment publishes a document that represents information associated
1382 with an *MTConnect Asset*, an *Agent* stores that document in a *buffer*. This *buffer* is called
1383 the *assets buffer*. The document is called an *Asset Document*.

1384 The *assets buffer* **MUST** be a separate *buffer* from the one where the *Streaming Data* is
1385 stored.

1386 The *Asset Document* that is published by the piece of equipment **MUST** be organized
1387 based upon one of the applicable *Asset Information Models* defined in one of the Parts 4.x
1388 of the MTConnect Standard.

1389 An *Agent* will only retain a limited number of *Asset Documents* in the *assets buffer*. The
1390 *assets buffer* functions similar to the *buffer* for *Streaming Data*; i.e., when the *assets buffer*
1391 is full, the oldest *Asset Document* is pushed from the *buffer*.

1392 *Figure 10* demonstrates the oldest *Asset Document* being pushed from the *assets buffer*
 1393 when a new *Asset Document* is added and the *assets buffer* is full:

Figure 10: First In First Out Asset Buffer Management

1394 Within an *Agent*, the management of *Asset Documents* behave like a key/value storage in a
 1395 database. In the case of *MTCConnect Assets*, the key is an identifier for an *Asset* (see details
 1396 on `assetId` in *MTCConnect Standard: Part 4.0 - Assets Information Model*) and the value
 1397 is the *Asset Document* that was published by the piece of equipment.

1398 *Figure 11* demonstrates the relationship between the key (`assetId`) and the stored *Asset*
 1399 *Documents*:

Figure 11: Relationship between `assetId` and stored *Asset documents*

1400 Note: The key (`assetId`) is independent of the order of the *Asset Documents* stored
1401 in the *assets buffer*.

1402 When an *Agent* receives a new *Asset Document* representing an *MTCConnect Asset*, it must
1403 determine whether this document represents an *MTCConnect Asset* that is not currently
1404 represented in the *assets buffer* or if the document represents new information for an *MT-*
1405 *Connect Asset* that is already represented in the *assets buffer*. When a new *Asset Document*
1406 is received, one of the following **MUST** occur:

1407 • If the *Asset Document* represents an *MTCConnect Asset* that is not currently repre-
1408 sented in the *assets buffer*, the *Agent* **MUST** add the new document to the front
1409 of the *assets buffer*. If the *assets buffer* is full, the oldest *Asset Document* will be
1410 removed from the *assets buffer*.

1411 • If the *Asset Document* represents an *MTCConnect Asset* that is already represented in
1412 the *assets buffer*, the *Agent* **MUST** remove the existing *Asset Document* representing
1413 that *MTCConnect Asset* from the *assets buffer* and add the new *Asset Document* to the
1414 front of the *assets buffer*.

1415 The *MTCConnect Standard* does not specify the maximum number of *Asset Documents*
1416 that may be stored in the *assets buffer*; that limit is determined by the implementation
1417 of a specific *Agent*. The number of *Asset Documents* that may be stored in an *Agent* is
1418 defined by the value for `assetBufferSize` (See *Section 6.5 - Document Header* for
1419 more information on `assetBufferSize`). A value of 4,294,967,296 or 2^{32} can be
1420 provided for `assetBufferSize` to indicate unlimited storage.

1421 There is no requirement for an *Agent* to provide persistence for the *Asset Documents* stored
1422 in the *assets buffer*. If an *Agent* should fail, all *Asset Documents* stored in the *assets buffer*
1423 **MAY** be lost. It is the responsibility of the implementer to determine if *Asset Documents*
1424 stored in an *Agent* may be restored or if those *Asset Documents* are retained by some other
1425 software application.

1426 Additional details on how an *Agent* organizes and manages information associated with
1427 *MTCConnect Assets* are provided in *MTCConnect Standard: Part 4.0 - Assets Information*
1428 *Model*.

1429 5.2 Response Documents

1430 *Response Documents* are electronic documents generated and published by an *Agent* in
1431 response to a *Request* for data.

1432 The *Response Documents* defined in the MTConnect Standard are:

- 1433 ● *MTConnectDevices Response Document*: An electronic document that contains the
1434 information published by an *Agent* describing the data that can be published by one
1435 or more piece(s) of equipment. The structure of the *MTConnectDevices Response*
1436 *Document* document is based upon the requirements defined by the *Devices Infor-*
1437 *mation Model*. See *MTConnect Standard: Part 2.0 - Devices Information Model* for
1438 details on this information model.
- 1439 ● *MTConnectStreams Response Document*: An electronic document that contains the
1440 information published by an *Agent* that contains the data that is published by one
1441 or more piece(s) of equipment. The structure of the *MTConnectStreams Response*
1442 *Document* document is based upon the requirements defined by the *Streams Infor-*
1443 *mation Model*. See *MTConnect Standard: Part 3.0 - Streams Information Model* for
1444 details on this information model.
- 1445 ● *MTConnectAssets Response Document*: An electronic document that contains the
1446 information published by an *Agent* that **MAY** include one or more *Asset Documents*.
1447 The structure of the *MTConnectAssets Response Document* document is based upon
1448 the requirements defined by the *Asset Information Models*. See *MTConnect Stan-*
1449 *dard: Part 4.0 - Assets Information Model* for details on this information model.
- 1450 ● *MTConnectErrors Response Document*: An electronic document that contains the
1451 information provided by an *Agent* when an error has occurred when trying to re-
1452 spond to a *Request* for data. The structure of the *MTConnectErrors Response Doc-*
1453 *ument* is based upon the requirements defined by the *Error Information Model*. See
1454 *Section 9 - Error Information Model* of this document for details on this information
1455 model.

1456 *Response Documents* may be represented by any document format supported by an *Agent*.
1457 No matter what document format is used to structure these documents, the requirements
1458 for representing the data and other information contained in those documents **MUST** ad-
1459 here to the requirements defined in the *Information Models* associated with each document.

1460 5.2.1 XML Documents

1461 XML is currently the only document format supported by the MTConnect Standard for
1462 encoding *Response Documents*. Other document formats may be supported in the future.

1463 Since XML is the document format supported by the MTConnect Standard for encoding
1464 documents, all examples demonstrating the structure of the *Response Documents* provided

1465 throughout the MTConnect Standard are based on XML. These documents will be referred
1466 to as *MTConnect XML Documents* or *XML Documents*.

1467 *Section 6 - XML Representation of Response Documents* defines how each document is
1468 structured as an *XML Document*.

1469 5.3 Semantic Data Models

1470 A *semantic data model* is a software engineering method for representing data where the
1471 context and the meaning of the data is constrained and fully defined.

1472 Each of the *semantic data models* defined by the MTConnect Standard include:

- 1473 • The types of information that may be published by a piece of equipment,
- 1474 • The meaning of that information and units of measure, if applicable,
- 1475 • Structural information that defines how different pieces of information relate to each
1476 other, and
- 1477 • Structural information that defines how the information relates to where the infor-
1478 mation was measured or generated by the piece of equipment.

1479 As described previously, the content of the *Response Documents* provided by an *Agent* are
1480 each defined by a specific *semantic data model*. The details for the *semantic data model*
1481 used to define each of the *Response Documents* are detail as follows:

- 1482 • *MTConnectDevices Response Document: MTConnect Standard: Part 2.0 - Devices*
1483 *Information Model*.
- 1484 • *MTConnectStreams Response Document: MTConnect Standard: Part 3.0 - Streams*
1485 *Information Model*.
- 1486 • *MTConnectAssets Response Document: MTConnect Standard: Part 4.0 - Assets*
1487 *Information Model* and its sub-Parts.
- 1488 • *MTConnectErrors Response Document: MTConnect Standard Part 1.0 - Overview*
1489 *and Fundamentals, Section 9 - Error Information Model*.

1490 Without semantics, a single piece of data does not convey any relevant meaning to a person
1491 or a client software application. However, when that piece of data is paired with some

1492 semantic context, the data inherits significantly more meaning. The data can then be more
1493 completely interpreted by a client software application without human intervention.

1494 The MTConnect *semantic data models* allows the information published by a piece of
1495 equipment to be transmitted to client software application with a full definition of the
1496 meaning of that information and in full context defining how that information relates to
1497 the piece of equipment that measured or generated the information.

1498 5.4 Request/Response Information Exchange

1499 The transfer of information between an *Agent* and a client software application is based
1500 on a *Request/Response* information exchange approach. A client software application
1501 requests specific information from an *Agent*. An *Agent* responds to the *Request* by pub-
1502 lishing a *Response Document*.

1503 In normal operation, there are four types of *MTConnect Requests* that can be issued by
1504 a client software application that will result in different *Responses* by an *Agent*. These
1505 *Requests* are:

- 1506 • *Probe Request*– A client software application requests the *Equipment Metadata* for
1507 each piece of equipment that **MAY** publish information through an *Agent*. The *Agent*
1508 publishes a *MTConnectDevices Response Document* that contains the requested in-
1509 formation. A *Probe Request* is represented by the term `probe` in a *Request* from a
1510 client software application.

- 1511 • *Current Request* – A client software application requests the current value for each
1512 of the data types that have been published from a piece(s) of equipment to an *Agent*.
1513 The *Agent* publishes a *MTConnectStreams Response Document* that contains the
1514 requested information. A *Current Request* is represented by the term `current` in
1515 a *Request* from a client software application.

- 1516 • *Sample Request* – A client software application requests a series of data values from
1517 the *buffer* in an *Agent* by specifying a range of *sequence numbers* representing that
1518 data. The *Agent* publishes a *MTConnectStreams Response Document* that contains
1519 the requested information. A *Sample Request* is represented by the term `sample` in
1520 a *Request* from a client software application.

- 1521 • *Asset Request* – A client software application requests information related to *MT-*
1522 *Connect Assets* that has been published to an *Agent*. The *Agent* publishes an *MT-*
1523 *ConnectAssets Response Document* that contains the requested information. An *As-*
1524 *set Request* is represented by the term `asset` in a *Request* from a client software
1525 application.

1526 Note: If an *Agent* is unable to respond to the request for information or the re-
 1527 quest includes invalid information, the *Agent* will publish an *MTConnectErrors*
 1528 *Response Document*. See *Section 9 - Error Information Model* for information
 1529 regarding *Error Information Model*

1530 The specific format for the *Request* for information from an *Agent* will depend on the
 1531 *Protocol* implemented as part of the *Request/Response* information exchange mechanism
 1532 deployed in a specific implementation. See *Section 7 - Protocol and Messaging, Protocol*
 1533 for details on implementing the *Request/Response* information exchange.

1534 Also, the specific format for the *Response Documents* may also be implementation de-
 1535 pendent. See *Section 6 - XML Representation of Response Documents* for details on the
 1536 format for the *Response Documents* encoded with XML.

1537 **5.5 Accessing Information from an Agent**

1538 Each of the *Requests* defined for the *Request/Response* information exchange requires
 1539 an *Agent* to respond with a specific view of the information stored by the *Agent*. The
 1540 following describes the relationships between the information stored by an *Agent* and the
 1541 contents of the *Response Documents*.

1542 **5.5.1 Accessing Equipment Metadata from an Agent**

1543 The *Equipment Metadata* associated with each piece of equipment that publishes infor-
 1544 mation to an *Agent* is typically static information that is maintained by the *Agent*. The
 1545 MTConnect Standard does not define how the *Agent* captures or maintains that informa-
 1546 tion. The only requirement that the MTConnect Standard places on an *Agent* regarding this
 1547 *Equipment Metadata* is that the *Agent* properly store this information and then configure
 1548 and publish a *MTConnectDevices Response Document* in response to a *Probe Request*.

1549 All issues associated with the capture and maintenance of the *Equipment Metadata* is the
 1550 responsibility of the implementer of a specific *Agent*.

1551 **5.5.2 Accessing Streaming Data from the Buffer of an Agent**

1552 There are two *Requests* defined for the *Request/Response* information exchange that re-
 1553 quire an *Agent* to provide different views of the information stored in the *buffer* of the
 1554 *Agent*. These *Requests* are *current* and *sample*.

1555 The example in *Figure 12* demonstrates how an *Agent* interprets the information stored
 1556 in the *buffer* to provide the content that is published in different versions of the *MTConnectStreams Response Document* based on the specific *Request* that is issued by a client
 1557 software application.
 1558

1559 In this example, an *Agent* with a *buffer* that can hold up to eight (8) *Data Entities*; i.e., the
 1560 value for `bufferSize` is 8. This *Agent* is collecting information for two pieces of data
 1561 – `Pos` representing a position and `Line` representing a line of logic or commands in a
 1562 control program.

1563 In this *buffer*, the value for `firstSequence` is 12 and the value for `lastSequence`
 1564 is 19. There are five (5) different values for `Pos` and three (3) different values for `Line`.

Figure 12: Example Buffer

1565 If an *Agent* receives a *Sample Request* from a client software application, the *Agent* **MUST**
 1566 publish an *MTConnectStreams Response Document* that contains a range of data values.
 1567 The range of values are defined by the `from` and `count` parameters that must be included
 1568 as part of the *Sample Request*. If the value of `from` is 14 and the value of `count` is 5,
 1569 the *Agent* **MUST** publish an *MTConnectStreams Response Document* that includes five
 1570 (5) pieces of data represented by *sequence numbers* 14, 15, 16, 17, and 18 – three (3)
 1571 occurrences of `Line` and two (2) occurrences of `Pos`. In this case, `nextSequence` will
 1572 also be returned with a value of 19.

1573 Likewise, if the same *Agent* receives a *Current Request* from a client software application,
 1574 the *Agent* **MUST** publish an *MTConnectStreams Response Document* that contains the
 1575 most current information available for each of the types of data that is being published to
 1576 the *Agent*. In this case, the specific data that **MUST** be represented in the *MTConnect-*
 1577 *Streams Response Document* is `Pos` with a value of 22 and a *sequence number* of 19 and
 1578 `Line` with a value of 227 and a *sequence number* of 18.

1579 There is also a derivation of the *Current Request* that will cause an *Agent* to publish an
1580 *MtConnectStreams Response Document* that contains a set of data relative to a specific
1581 sequence number. The *Current Request* **MAY** include an additional parameter called *at*.
1582 When the *at* parameter, along with an *instanceId*, is included as part of a *Current Re-*
1583 *quest*, an *Agent* **MUST** publish an *MtConnectStreams Response Document* that contains
1584 the most current information available for each of the types of *Data Entities* that are being
1585 published to the *Agent* that occur immediately at or before the *sequence number* specified
1586 with the *at* parameter.

1587 For example, if the *Request* is *current?at=15*, an *Agent* **MUST** publish a *MtCon-*
1588 *nectStreams Response Document* that contains the most current information available for
1589 each of the *Data Entities* that are stored in the *buffer* of the *Agent* with a *sequence number*
1590 of 15 or lower. In this case, the specific data that **MUST** be represented in the *MtCon-*
1591 *nectStreams Response Document* is *Pos* with a value of 10 and a *sequence number* of 13
1592 and *Line* with a value of 220 and a *sequence number* of 15.

1593 If a *current Request* is received for a *sequence number* of 11 or lower, an *Agent* **MUST**
1594 return an *OUT_OF_RANGE MtConnectErrors Response Document*. The same *HTTP Er-*
1595 *ror Message* **MUST** be given if a *sequence number* is requested that is greater than the
1596 end of the *buffer*. See *Section 9 - Error Information Model* for more information on *MT-*
1597 *ConnectErrors Response Document*.

1598 5.5.3 Accessing MtConnect Assets Information from an Agent

1599 When an *Agent* receives an *Asset Request*, the *Agent* **MUST** publish an *MtConnectAs-*
1600 *sets* document that contains information regarding the *Asset Documents* that are stored
1601 in the *Agent*.

1602 See *MtConnect Standard: Part 4.0 - Assets Information Model* for details on *MtConnect*
1603 *Assets*, *Asset Requests*, and the *MtConnectAssets Response Document*.

1604 6 XML Representation of Response Documents

1605 As defined in *Section 5.2.1 - XML Documents*, XML is currently the only language sup-
1606 ported by the MTConnect Standard for encoding *Response Documents*.

1607 *Response Documents* must be valid and conform to the *schema* defined in the *semantic*
1608 *data model* defined for that document. The *schema* for each *Response Document* **MUST**
1609 be updated to correlate to a specific version of the MTConnect Standard. Versions, within
1610 a *major* version, of the MTConnect Standard will be defined in such a way to best maintain
1611 backwards compatibility of the *semantic data models* through all *minor* revisions of the
1612 Standard. However, new *minor* versions may introduce extensions or enhancements to
1613 existing *semantic data models*.

1614 To be valid, a *Response Document* must be well-formed; meaning that, amongst other
1615 things, each element has the required XML *start-tag* and *end-tag* and that the document
1616 does not contain any illegal characters. The validation of the document may also include
1617 a determination that required elements and attributes are present, they only occur in the
1618 appropriate location in the document, and they appear only the correct number of times.
1619 If the document is not well-formed, it may be rejected by a client software application.
1620 The *semantic data model* defined for each *Response Document* also specifies the elements
1621 and *Child Elements* that may appear in a document. XML elements may contain *Child*
1622 *Elements*, CDATA, or both. The *semantic data model* also defines the number of times
1623 each element and *Child Element* may appear in the document.

1624 Each *Response Document* encoded using XML consists of the following primary sections:

- 1625 ● XML Declaration
- 1626 ● Root Element
- 1627 ● Schema and Namespace Declaration
- 1628 ● Document Header
- 1629 ● Document Body

1630 The following will provide details defining how each of the *Response Documents* are en-
1631 coded using XML.

1632 Note: See *Section 3 - Terminology and Conventions* for the definition of XML related
1633 terms used in the MTConnect Standard.

1634 6.1 Fundamentals of Using XML to Encode Response Documents

1635 The MTConnect Standard follows industry conventions for formatting the elements and
1636 attributes included in an XML document. The general guidelines are as follows:

1637 • All element names **MUST** be specified in Pascal case (first letter of each word is
1638 capitalized). For example: <PowerSupply/>.

1639 • The name for an attribute **MUST** be Camel case; similar to Pascal case, but the first
1640 letter will be lower case. For example: <MyElement nativeName="bob"/>
1641 where MyElement is the *Element Name* and nativeName is an attribute.

1642 • All CDATA values that are defined with a limited or controlled vocabulary **MUST**
1643 be in upper case with an _ (underscore) separating words. For example: ON, OFF,
1644 ACTUAL, and COUNTER_CLOCKWISE.

1645 • The values provided for a date and/or a time **MUST** follow the W3C ISO 8601
1646 format with an arbitrary number of decimals representing fractions of a second.
1647 Refer to the following specification for details on the format for dates and times:
1648 <http://www.w3.org/TR/NOTE-datetime>.

1649 The format for the value describing a date and a time will be
1650 YYYY-MM-DDThh:mm:ss.ffff. An example would be: 2017-01-13T13:01.213415Z.

1651 Note: Z refers to UTC/GMT time, not local time.

1652 The accuracy and number of decimals representing fractions of a second for a `timeStamp`
1653 **MUST** be determined by the capabilities of the piece of equipment publishing
1654 information to an *Agent*. All time values **MUST** be provided in UTC (GMT).

1655 • XML element names **MUST** be spelled out and abbreviations are not permitted. See
1656 the exclusion below regarding the use of the suffix `Ref`.

1657 • XML attribute names **SHOULD** be spelled out and abbreviations **SHOULD** be
1658 avoided. The exception to this rule is the use of `id` when associated with an identi-
1659 fier. See the exclusion below regarding the use of the suffix `Ref`.

1660 • The abbreviation `Ref` for *Reference* is permitted as a suffix to element names of
1661 either a *Structural Element* or a *Data Entity* to provide an efficient method to asso-
1662 ciate information defined in another location in a *Data Model* without duplicating
1663 that original data or structure. See *Section 4.8* in *MTConnect Standard: Part 2.0 -*
1664 *Devices Information Model* for more information on *Reference*.

1665 6.2 XML Declaration

1666 The first section of a *Response Document* encoded with XML **SHOULD** be the *XML*
1667 *Declaration*. The declaration is a single element.

1668 An example of an *XML Declaration* would be:

Example 2: Example of xml declaration

```
1669 1 <?xml version="1.0" encoding="UTF-8"?>
```

1670 This element provides information regarding how the XML document is encoded and the
1671 character type used for that encoding. See the W3C website for more details on the XML
1672 declaration.

1673 6.3 Root Element

1674 Every *Response Document* **MUST** contain only one root element. The MTConnect Stan-
1675 dard defines `MTConnectDevices`, `MTConnectStreams`, `MTConnectAssets`, and
1676 `MTConnectError` as *Root Elements*.

1677 The *Root Element* specifies a specific *Response Document* and appears at the top of the
1678 document immediately following the *XML Declaration*.

1679 6.3.1 MTConnectDevices Root Element

1680 `MTConnectDevices` is the *Root Element* for the *MTConnectDevices Response Docu-*
1681 *ment*.

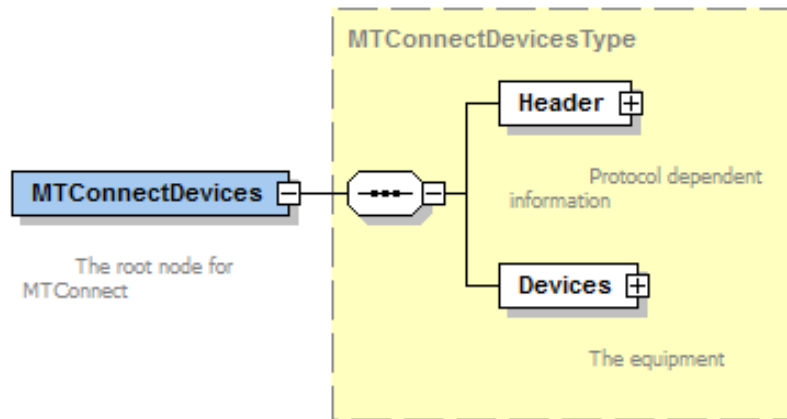

Figure 13: MTConnectDevices Structure

1682 MTConnectDevices **MUST** contain two *Child Elements* - Header and Devices.
 1683 Details for Header are defined in Section 6.5 - Document Header.

1684 Devices is an XML container that represents the *Document Body* for an *MTConnectDe-*
 1685 *VICES Response Document* – see Section 6.6 - Document Body. Details for the *semantic*
 1686 *data model* describing the contents for Devices are defined in *MTConnect Standard:*
 1687 *Part 2.0 - Devices Information Model*.

1688 MTConnectDevices also has a number of attributes. These attributes are defined in
 1689 Section 6.4 - Schema and Namespace Declaration.

1690 **6.3.1.1 MTConnectDevices Elements**

1691 An MTConnectDevices element **MUST** contain a Header and a Devices element.

Table 1: Elements for MTConnectDevices

| Element | Description | Occurrence |
|---------|---|------------|
| Header | An XML container in an <i>MTConnect Response Document</i> that provides information from an <i>Agent</i> defining version information, storage capacity, and parameters associated with the data management within the <i>Agent</i> . | 1 |

| Continuation of Table 1 | | |
|-------------------------|--|------------|
| Element | Description | Occurrence |
| Devices | The XML container in an <i>MTConnect Response Document</i> that provides the <i>Equipment Metadata</i> for each of the pieces of equipment associated with an <i>Agent</i> . | 1 |

1692 6.3.2 MTConnectStreams Root Element

1693 MTConnectStreams is the *Root Element* for the *MTConnectStreams Response Document*.
 1694

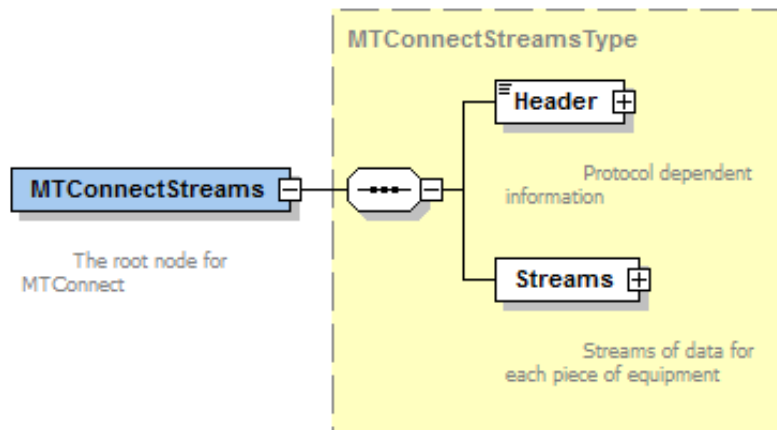

Figure 14: MTConnectStreams Structure

1695 `MTConnectStreams` **MUST** contain two *Child Elements* - `Header` and `Streams`.

1696 Details for `Header` are defined in *Section 6.5 - Document Header*.

1697 `Streams` is an XML container that represents the *Document Body* for a *MTConnect-*
 1698 *Streams Response Document* – see *Section 6.6 - Document Body*. Details for the *semantic*
 1699 *data model* describing the contents for `Streams` are defined in *MTConnect Standard:*
 1700 *Part 3.0 - Streams Information Model*.

1701 `MTConnectStreams` also has a number of attributes. These attributes are defined in
 1702 *Section 6.4 - Schema and Namespace Declaration*.

1703 **6.3.2.1 MTConnectStreams Elements**

1704 An `MTConnectStreams` element **MUST** contain a `Header` and a `Streams` element.

Table 2: Elements for `MTConnectStreams`

| Element | Description | Occurrence |
|---------|---|------------|
| Header | An XML container in an <i>MTConnect Response Document</i> that provides information from an <i>Agent</i> defining version information, storage capacity, and parameters associated with the data management within the <i>Agent</i> . | 1 |
| Streams | The XML container for the information published by an <i>Agent</i> in a <i>MTConnectStreams Response Document</i> . | 1 |

1705 **6.3.3 MTConnectAssets Root Element**

1706 `MTConnectAssets` is the *Root Element* for the *MTConnectAssets Response Document*.

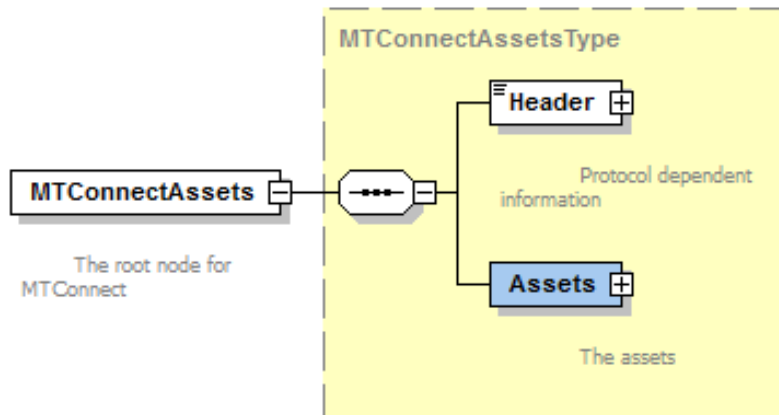

Figure 15: `MTConnectAssets` Structure

1707 `MTConnectAssets` **MUST** contain two *Child Elements* - `Header` and `Assets`.

1708 Details for `Header` are defined in *Section 6.5 - Document Header*.

1709 `Assets` is an XML container that represents the *Document Body* for an *MTConnectAssets Response Document* – see *Section 6.6 - Document Body*. Details for the *semantic data model* describing the contents for `Assets` are defined in *MTConnect Standard: Part 4.0 - Assets Information Model*.

1713 `MTConnectAssets` also has a number of attributes. These attributes are defined in *Section 6.4 - Schema and Namespace Declaration*.

1715 **6.3.3.1 MTConnectAssets Elements**

1716 An `MTConnectAssets` element **MUST** contain a `Header` and an `Assets` element.

Table 3: Elements for `MTConnectAssets`

| Element | Description | Occurrence |
|---------|---|------------|
| Header | An XML container in an <i>MTConnect Response Document</i> that provides information from an <i>Agent</i> defining version information, storage capacity, and parameters associated with the data management within the <i>Agent</i> . | 1 |
| Assets | The XML container in an <i>MTConnectAssets Response Document</i> that provides information for <i>MTConnect Assets</i> associated with an <i>Agent</i> . | 1 |

1717 **6.3.4 MTConnectError Root Element**

1718 `MTConnectError` is the *Root Element* for the *MTConnectErrors Response Document*.

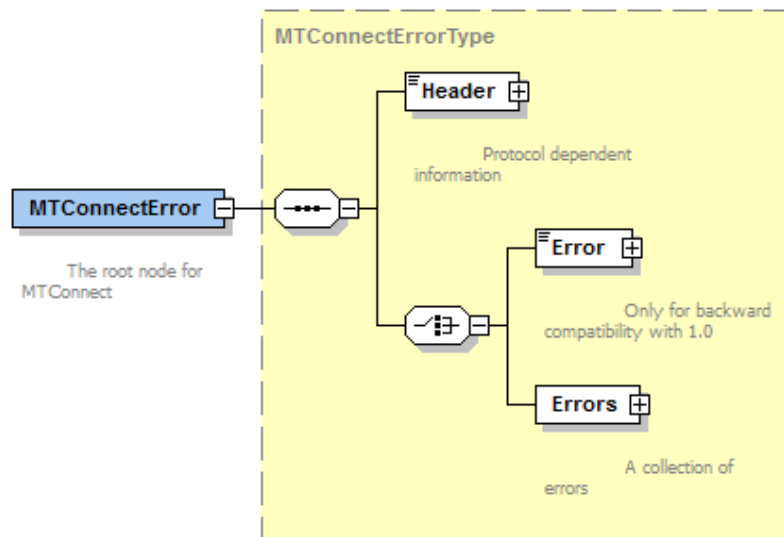

Figure 16: MTConnectError Structure

1719 MTConnectError **MUST** contain two *Child Elements* - Header and Errors.

1720 Note: When compatibility with *Version 1.0.1* and earlier of the MTConnect Standard
 1721 is required for an implementation, the *MTConnectErrors Response Document*
 1722 contains only a single Error *Data Entity* and the Errors *Child Element*
 1723 **MUST NOT** appear in the document.

1724 Details for Header are defined in *Section 6.5 - Document Header*.

1725 Errors is an XML container that represents the *Document Body* for an *MTConnectErrors*
 1726 *Response Document* – See *Section 6.6 - Document Body*. Details for the *semantic data*
 1727 *model* describing the contents for Errors are defined in *Section 9 - Error Information*
 1728 *Model*.

1729 MTConnectError also has a number of attributes. These attributes are defined in *Sec-*
 1730 *tion 6.4 - Schema and Namespace Declaration*.

1731 6.3.4.1 MTConnectError Elements

1732 An MTConnectError element **MUST** contain a Header and an Errors element.

Table 4: Elements for MTConnectError

| Element | Description | Occurrence |
|---------|---|------------|
| Header | An XML container in an <i>MTConnect Response Document</i> that provides information from an <i>Agent</i> defining version information, storage capacity, and parameters associated with the data management within the <i>Agent</i> . | 1 |
| Errors | The XML container in an <i>MTConnectErrors Response Document</i> that provides information associated with errors encountered by an <i>Agent</i> . | 1 |

1733 6.4 Schema and Namespace Declaration

1734 XML provides standard methods for declaring the *schema* and *namespace* associated with
 1735 a document encoded by XML. The declaration of the *schema* and *namespace* for MTCon-
 1736 nect *Response Documents* **MUST** be structured as attributes in the *Root Element* of the
 1737 document. XML defines these attributes as pseudo-attributes since they provide additional
 1738 information for the entire document and not just specifically for the *Root Element* itself.

1739 Note: If a *Response Document* contains sections that utilize different *schemas* and/or
 1740 *namespaces*, additional pseudo-attributes should appear in the document as de-
 1741 clared using standard conventions as defined by W3C.

1742 For further information on declarations refer to *Appendix C*.

1743 6.5 Document Header

1744 The *Document Header* is an XML container in an *MTConnect Response Document* that
 1745 provides information from an *Agent* defining version information, storage capacity, and
 1746 parameters associated with the data management within the *Agent*. This XML element is
 1747 called `Header`.

1748 `Header` **MUST** be the first XML element following the *Root Element* of any *Response*
 1749 *Document*. The `Header` XML element **MUST NOT** contain any *Child Elements*.

1750 The content of the `Header` element will be different for each type of *Response Document*.

1751 6.5.1 Header for MTConnectDevices

1752 The `Header` element for an *MTConnectDevices Response Document* defines information
 1753 regarding the creation of the document and the data storage capability of the *Agent* that
 1754 generated the document.

1755 6.5.1.1 XML Schema Structure for Header for MTConnectDevices

1756 The *XML Schema* in *Figure 17* represents the structure of the `Header` XML element that
 1757 **MUST** be provided for an *MTConnectDevices Response Document*.

Figure 17: Header Schema Diagram for MTConnectDevices

1758 6.5.1.2 Attributes for Header for MTConnectDevices

1759 *Table 5* defines the attributes that may be used to provide additional information in the
 1760 `Header` element for an *MTConnectDevices Response Document*.

Table 5: MTConnectDevices Header

| Attribute | Description | Occurrence |
|--------------|--|------------|
| version | <p>The <i>major</i>, <i>minor</i>, and <i>revision</i> number of the MTConnect Standard that defines the <i>semantic data model</i> that represents the content of the <i>Response Document</i>. It also includes the revision number of the <i>schema</i> associated with that specific <i>semantic data model</i>.</p> <p>The value reported for <code>version</code> MUST be a series of four numeric values, separated by a decimal point, representing a <i>major</i>, <i>minor</i>, and <i>revision</i> number of the MTConnect Standard and the revision number of a specific <i>schema</i>.</p> <p>As an example, the value reported for <code>version</code> for a <i>Response Document</i> that was structured based on <i>schema</i> revision 10 associated with Version 1.4.0 of the MTConnect Standard would be: 1.4.0.10</p> <p><code>version</code> is a required attribute.</p> | 1 |
| creationTime | <p><code>creationTime</code> represents the time that an <i>Agent</i> published the <i>Response Document</i>.</p> <p><code>creationTime</code> MUST be reported in UTC (Coordinated Universal Time) format; e.g., "2010-04-01T21:22:43Z".</p> <p>Note: Z refers to UTC/GMT time, not local time.</p> <p><code>creationTime</code> is a required attribute.</p> | 1 |

| Continuation of Table 5 | | |
|-------------------------|--|------------|
| Attribute | Description | Occurrence |
| testIndicator | <p>A flag indicating that the <i>Agent</i> that published the <i>Response Document</i> is operating in a test mode. The contents of the <i>Response Document</i> may not be valid and SHOULD be used for testing and simulation purposes only.</p> <p>The values reported for testIndicator are:</p> <ul style="list-style-type: none"> - true: The <i>Agent</i> is functioning in a test mode. - false: The <i>Agent</i> is not functioning in a test mode. <p>If testIndicator is not specified, the value for testIndicator MUST be interpreted to be false.</p> <p>testIndicator is an optional attribute.</p> | 0..1 |
| instanceId | <p>A number indicating a specific instantiation of the <i>buffer</i> associated with the <i>Agent</i> that published the <i>Response Document</i>.</p> <p>The value reported for instanceId MUST be a unique unsigned 64-bit integer.</p> <p>The value for instanceId MUST be changed to a different unique number each time the <i>buffer</i> is cleared and a new set of data begins to be collected.</p> <p>instanceId is a required attribute.</p> | 1 |

| Continuation of Table 5 | | |
|-------------------------|--|------------|
| Attribute | Description | Occurrence |
| sender | <p>An identification defining where the <i>Agent</i> that published the <i>Response Document</i> is installed or hosted.</p> <p>The value reported for <code>sender</code> MUST be either an IP Address or Hostname describing where the <i>Agent</i> is installed or the URL of the <i>Agent</i>; e.g., <code>http://<address>[:port]/</code>.</p> <p>Note: The port number need not be specified if it is the default HTTP port 80.</p> <p><code>sender</code> is a required attribute.</p> | 1 |
| bufferSize | <p>A value representing the maximum number of <i>Data Entities</i> that MAY be retained in the <i>Agent</i> that published the <i>Response Document</i> at any point in time.</p> <p>The value reported for <code>bufferSize</code> MUST be a number representing an unsigned 32-bit integer.</p> <p><code>bufferSize</code> is a required attribute.</p> <p>Note 1: <code>bufferSize</code> represents the maximum number of sequence numbers that MAY be stored in the <i>Agent</i>.</p> <p>Note 2: The implementer is responsible for allocating the appropriate amount of storage capacity required to accommodate the <code>bufferSize</code>.</p> | 1 |

| Continuation of Table 5 | | |
|-------------------------|---|------------|
| Attribute | Description | Occurrence |
| assetBufferSize | <p>A value representing the maximum number of <i>Asset Documents</i> that can be stored in the <i>Agent</i> that published the <i>Response Document</i>.</p> <p>The value reported for <code>assetBufferSize</code> MUST be a number representing an unsigned 32-bit integer.</p> <p><code>assetBufferSize</code> is a required attribute.</p> <p>Note: The implementer is responsible for allocating the appropriate amount of storage capacity required to accommodate the <code>assetBufferSize</code>.</p> | 1 |
| assetCount | <p>A number representing the current number of <i>Asset Documents</i> that are currently stored in the <i>Agent</i> as of the <code>creationTime</code> that the <i>Agent</i> published the <i>Response Document</i>.</p> <p>The value reported for <code>assetCount</code> MUST be a number representing an unsigned 32-bit integer and MUST NOT be larger than the value reported for <code>assetBufferSize</code>.</p> <p><code>assetCount</code> is a required attribute.</p> | 1 |
| deviceModelChangeTime | <p>A timestamp in 8601 format of the last update of the <i>Device</i> information for any device.</p> | 1 |

1761 *Example 3* is an example of a Header XML element for an *MTConnectDevices Response*
 1762 *Document*:

Example 3: Example of Header XML Element for *MTConnectDevices*

```
1763 1 <Header creationTime="2017-02-16T16:44:27Z"
1764 2   sender="MyAgent" instanceId="1268463594"
```

```

1765 3   bufferSize="131072" version="1.4.0.10"
1766 4   assetCount="54" assetBufferSize="1024"/>

```

1767 6.5.2 Header for MTConnectStreams

1768 The `Header` element for an *MTConnectStreams Response Document* defines informa-
 1769 tion regarding the creation of the document and additional information necessary for an
 1770 application to interact and retrieve data from the *Agent*.

1771 6.5.2.1 XML Schema Structure for Header for MTConnectStreams

1772 The *XML Schema* in *Figure 18* represents the structure of the `Header` XML element that
 1773 **MUST** be provided for an *MTConnectStreams Response Document*.

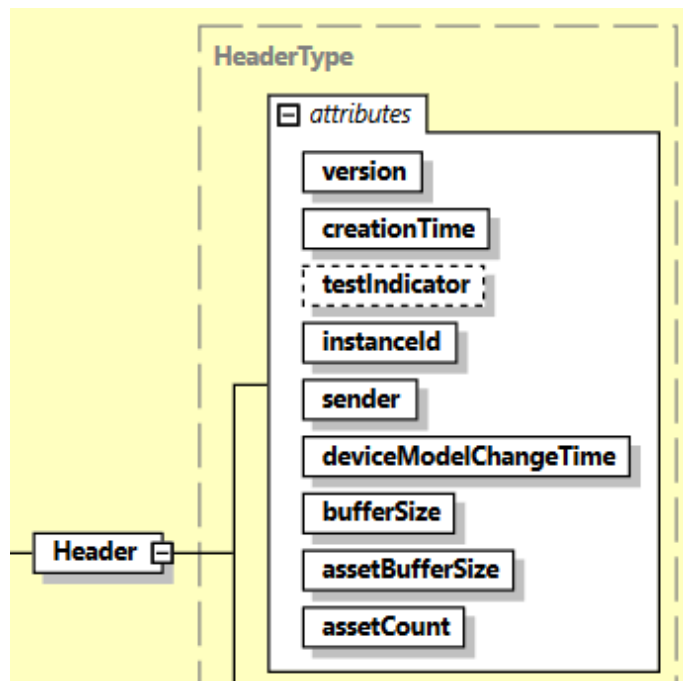

Figure 18: Header Schema Diagram for MTConnectStreams

1774 6.5.2.2 Attributes for MTConnectStreams Header

1775 *Table 6* defines the attributes that may be used to provide additional information in the
 1776 `Header` element for an *MTConnectStreams Response Document*.

Table 6: MTConnectStreams Header

| Attribute | Description | Occurrence |
|--------------|--|------------|
| version | <p>The <i>major</i>, <i>minor</i>, and <i>revision</i> number of the MTConnect Standard that defines the <i>semantic data model</i> that represents the content of the <i>Response Document</i>. It also includes the revision number of the <i>schema</i> associated with that specific <i>semantic data model</i>.</p> <p>The value reported for <code>version</code> MUST be a series of four numeric values, separated by a decimal point, representing a <i>major</i>, <i>minor</i>, and <i>revision</i> number of the MTConnect Standard and the revision number of a specific <i>schema</i>.</p> <p>As an example, the value reported for <code>version</code> for a <i>Response Document</i> that was structured based on <i>schema</i> revision 10 associated with Version 1.4.0 of the MTConnect Standard would be: 1.4.0.10</p> <p><code>version</code> is a required attribute.</p> | 1 |
| creationTime | <p><code>creationTime</code> represents the time that an <i>Agent</i> published the <i>Response Document</i>.</p> <p><code>creationTime</code> MUST be reported in UTC (Coordinated Universal Time) format; e.g., "2010-04-01T21:22:43Z".</p> <p>Note: Z refers to UTC/GMT time, not local time.</p> <p><code>creationTime</code> is a required attribute.</p> | 1 |

| Continuation of Table 6 | | |
|-------------------------|--|------------|
| Attribute | Description | Occurrence |
| nextSequence | <p>A number representing the <i>sequence number</i> of the piece of <i>Streaming Data</i> that is the next piece of data to be retrieved from the <i>buffer</i> of the <i>Agent</i> that was not included in the Response Document published by the <i>Agent</i>.</p> <p>If the <i>Streaming Data</i> included in the Response Document includes the last piece of data stored in the <i>buffer</i> of the <i>Agent</i> at the time that the document was published, then the value reported for nextSequence MUST be equal to lastSequence + 1.</p> <p>The value reported for nextSequence MUST be a number representing an unsigned 64-bit integer.</p> <p>nextSequence is a required attribute.</p> | 1 |
| lastSequence | <p>A number representing the <i>sequence number</i> assigned to the last piece of <i>Streaming Data</i> that was added to the <i>buffer</i> of the <i>Agent</i> immediately prior to the time that the <i>Agent</i> published the Response Document.</p> <p>The value reported for lastSequence MUST be a number representing an unsigned 64-bit integer.</p> <p>lastSequence is a required attribute.</p> | 1 |

| Continuation of Table 6 | | |
|-------------------------|--|------------|
| Attribute | Description | Occurrence |
| firstSequence | <p>A number representing the <i>sequence number</i> assigned to the oldest piece of <i>Streaming Data</i> stored in the <i>buffer</i> of the <i>Agent</i> immediately prior to the time that the <i>Agent</i> published the Response Document.</p> <p>The value reported for firstSequence MUST be a number representing an unsigned 64-bit integer.</p> <p>firstSequence is a required attribute.</p> | 1 |
| testIndicator | <p>A flag indicating that the <i>Agent</i> that published the <i>Response Document</i> is operating in a test mode. The contents of the <i>Response Document</i> may not be valid and SHOULD be used for testing and simulation purposes only.</p> <p>The values reported for testIndicator are:</p> <ul style="list-style-type: none"> - true: The <i>Agent</i> is functioning in a test mode. - false: The <i>Agent</i> is not functioning in a test mode. <p>If testIndicator is not specified, the value for testIndicator MUST be interpreted to be false.</p> <p>testIndicator is an optional attribute.</p> | 0..1 |

| Continuation of Table 6 | | |
|-------------------------|---|------------|
| Attribute | Description | Occurrence |
| instanceId | <p>A number indicating a specific instantiation of the <i>buffer</i> associated with the <i>Agent</i> that published the <i>Response Document</i>.</p> <p>The value reported for <code>instanceId</code> MUST be a unique unsigned 64-bit integer.</p> <p>The value for <code>instanceId</code> MUST be changed to a different unique number each time the <i>buffer</i> is cleared and a new set of data begins to be collected.</p> <p><code>instanceId</code> is a required attribute.</p> | 1 |
| sender | <p>An identification defining where the <i>Agent</i> that published the <i>Response Document</i> is installed or hosted.</p> <p>The value reported for <code>sender</code> MUST be either an IP Address or Hostname describing where the <i>Agent</i> is installed or the URL of the <i>Agent</i>; e.g., <code>http://<address>[:port]/</code>.</p> <p>Note: The port number need not be specified if it is the default HTTP port 80.</p> <p><code>sender</code> is a required attribute.</p> | 1 |

| Continuation of Table 6 | | |
|-------------------------|---|------------|
| Attribute | Description | Occurrence |
| bufferSize | <p>A value representing the maximum number of <i>Data Entities</i> that MAY be retained in the <i>Agent</i> that published the <i>Response Document</i> at any point in time.</p> <p>The value reported for bufferSize MUST be a number representing an unsigned 32-bit integer.</p> <p>bufferSize is a required attribute.</p> <p>Note 1: bufferSize represents the maximum number of <i>sequence numbers</i> that MAY be stored in the <i>Agent</i>.</p> <p>Note 2: The implementer is responsible for allocating the appropriate amount of storage capacity required to accommodate the bufferSize.</p> | 1 |
| deviceModelChangeTime | A timestamp in 8601 format of the last update of the <i>Device</i> information for any device. | 1 |

1777 *Example 4* is an example of a Header XML element for an *MTCConnectStreams Response*
1778 *Document*:

Example 4: Example of Header XML Element for MTCConnectStreams

```

1779 1 <Header lastSequence="5430495" firstSequence="5299424"
1780 2   nextSequence="5430496" bufferSize="131072"
1781 3   version="1.4.0.12" instanceId="1579788747"
1782 4   sender="myagent" creationTime="2020-03-24T13:23:32Z"/>

```

1783 6.5.3 Header for MTCConnectAssets

1784 The Header element for an *MTCConnectAssets Response Document* defines information
1785 regarding the creation of the document and the storage of *Asset Documents* in the *Agent*
1786 that generated the document.

1787 **6.5.3.1 XML Schema Structure for Header for MTConnectAssets**

1788 The XML Schema in Figure 19 represents the structure of the `Header` XML element that
 1789 **MUST** be provided for an *MTConnectAssets Response Document*.

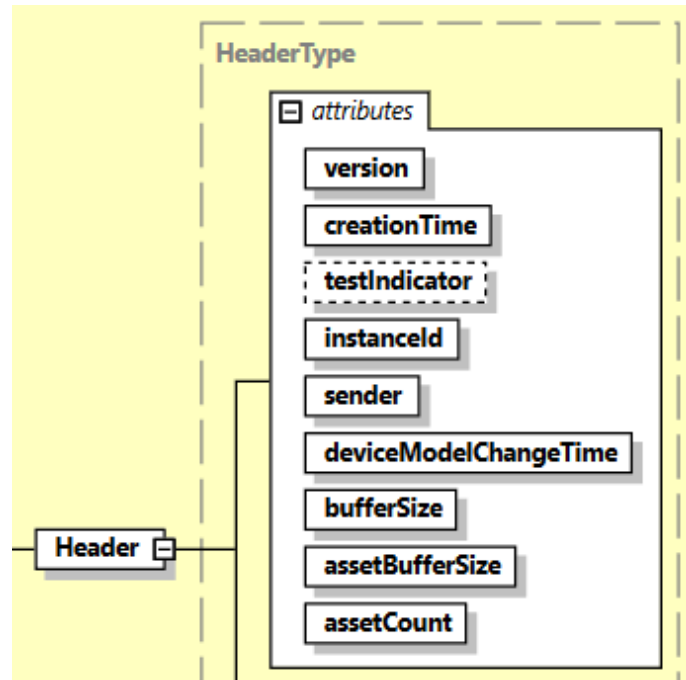

Figure 19: Header Schema Diagram for MTConnectAssets

1790 **6.5.3.2 Attributes for Header for MTConnectAssets**

1791 *Table 7* defines the attributes that may be used to provide additional information in the
 1792 `Header` element for an *MTConnectAssets Response Document*.

Table 7: MTConnectAssets Header

| Attribute | Description | Occurrence |
|--------------|--|------------|
| version | <p>The <i>major</i>, <i>minor</i>, and <i>revision</i> number of the MTConnect Standard that defines the <i>semantic data model</i> that represents the content of the <i>Response Document</i>. It also includes the revision number of the <i>schema</i> associated with that specific <i>semantic data model</i>.</p> <p>The value reported for <code>version</code> MUST be a series of four numeric values, separated by a decimal point, representing a <i>major</i>, <i>minor</i>, and <i>revision</i> number of the MTConnect Standard and the revision number of a specific <i>schema</i>.</p> <p>As an example, the value reported for <code>version</code> for a <i>Response Document</i> that was structured based on <i>schema</i> revision 10 associated with Version 1.4.0 of the MTConnect Standard would be: 1.4.0.10</p> <p><code>version</code> is a required attribute.</p> | 1 |
| creationTime | <p><code>creationTime</code> represents the time that an <i>Agent</i> published the <i>Response Document</i>.</p> <p><code>creationTime</code> MUST be reported in UTC (Coordinated Universal Time) format; e.g., "2010-04-01T21:22:43Z".</p> <p>Note: Z refers to UTC/GMT time, not local time.</p> <p><code>creationTime</code> is a required attribute.</p> | 1 |

| Continuation of Table 7 | | |
|-------------------------|--|------------|
| Attribute | Description | Occurrence |
| testIndicator | <p>A flag indicating that the <i>Agent</i> that published the <i>Response Document</i> is operating in a test mode. The contents of the <i>Response Document</i> may not be valid and SHOULD be used for testing and simulation purposes only.</p> <p>The values reported for testIndicator are:</p> <ul style="list-style-type: none"> - true: The <i>Agent</i> is functioning in a test mode. - false: The <i>Agent</i> is not functioning in a test mode. <p>If testIndicator is not specified, the value for testIndicator MUST be interpreted to be false.</p> <p>testIndicator is an optional attribute.</p> | 0..1 |
| instanceId | <p>A number indicating a specific instantiation of the <i>buffer</i> associated with the <i>Agent</i> that published the <i>Response Document</i>.</p> <p>The value reported for instanceId MUST be a unique unsigned 64-bit integer.</p> <p>The value for instanceId MUST be changed to a different unique number each time the <i>buffer</i> is cleared and a new set of data begins to be collected.</p> <p>instanceId is a required attribute.</p> | 1 |

| Continuation of Table 7 | | |
|-------------------------|---|------------|
| Attribute | Description | Occurrence |
| sender | <p>An identification defining where the <i>Agent</i> that published the <i>Response Document</i> is installed or hosted.</p> <p>The value reported for <code>sender</code> MUST be either an IP Address or Hostname describing where the <i>Agent</i> is installed or the URL of the <i>Agent</i>; e.g., <code>http://<address>[:port]/</code>.</p> <p>Note: The port number need not be specified if it is the default HTTP port 80.</p> <p><code>sender</code> is a required attribute.</p> | 1 |
| assetBufferSize | <p>A value representing the maximum number of <i>Asset Documents</i> that can be stored in the <i>Agent</i> that published the <i>Response Document</i>.</p> <p>The value reported for <code>assetBufferSize</code> MUST be a number representing an unsigned 32-bit integer.</p> <p><code>assetBufferSize</code> is a required attribute.</p> <p>Note: The implementer is responsible for allocating the appropriate amount of storage capacity required to accommodate the <code>assetBufferSize</code>.</p> | 1 |

| Continuation of Table 7 | | |
|-------------------------|---|------------|
| Attribute | Description | Occurrence |
| assetCount | <p>A number representing the current number of <i>Asset Documents</i> that are currently stored in the <i>Agent</i> as of the <i>creationTime</i> that the <i>Agent</i> published the <i>Response Document</i>.</p> <p>The value reported for <i>assetCount</i> MUST be a number representing an unsigned 32-bit integer and MUST NOT be larger than the value reported for <i>assetBufferSize</i>.</p> <p><i>assetCount</i> is a required attribute.</p> | 1 |
| deviceModelChangeTime | A timestamp in 8601 format of the last update of the <i>Device</i> information for any device. | 1 |

1793 *Example 5* is an example of a `Header` XML element for an *MTConnectAssets Response Document*:

Example 5: Example of Header XML Element for *MTConnectAssets*

```

1795 1 <Header creationTime="2017-02-16T16:44:27Z"
1796 2   sender="MyAgent" instanceId="1268463594"
1797 3   version="1.4.0.10" assetCount="54"
1798 4   assetBufferSize="1024"/>

```

1799 6.5.4 Header for *MTConnectError*

1800 The `Header` element for an *MTConnectErrors Response Document* defines information
1801 regarding the creation of the document and the data storage capability of the *Agent* that
1802 generated the document.

1803 6.5.4.1 XML Schema Structure for Header for *MTConnectError*

1804 The *XML Schema* in *Figure 20* represents the structure of the `Header` XML element that
1805 **MUST** be provided for an *MTConnectErrors Response Document*.

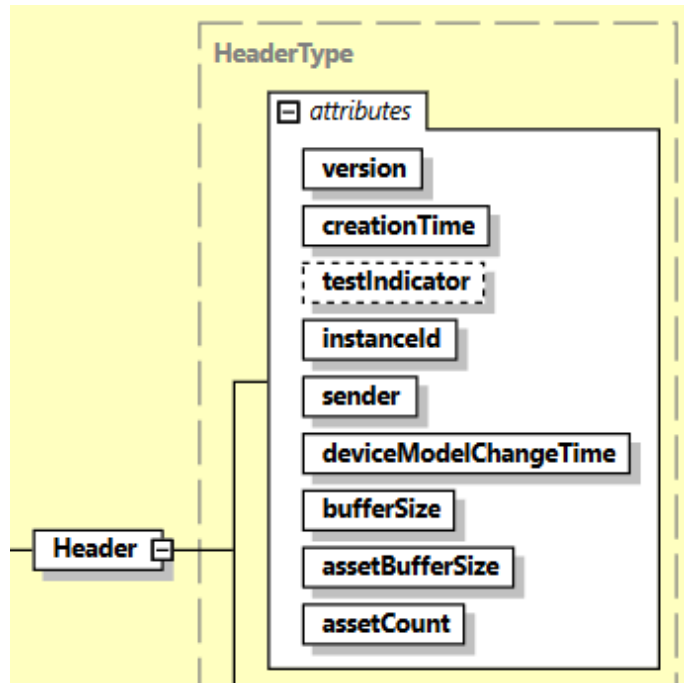

Figure 20: Header Schema Diagram for MTConnectError

1806 **6.5.4.2 Attributes for Header for MTConnectError**

1807 *Table 8* defines the attributes that may be used to provide additional information in the
1808 `Header` element for an *MTConnectErrors Response Document*.

Table 8: MTConnectError Header

| Attribute | Description | Occurrence |
|--------------|--|------------|
| version | <p>The <i>major</i>, <i>minor</i>, and <i>revision</i> number of the MTConnect Standard that defines the <i>semantic data model</i> that represents the content of the <i>Response Document</i>. It also includes the revision number of the <i>schema</i> associated with that specific <i>semantic data model</i>.</p> <p>The value reported for <code>version</code> MUST be a series of four numeric values, separated by a decimal point, representing a <i>major</i>, <i>minor</i>, and <i>revision</i> number of the MTConnect Standard and the revision number of a specific <i>schema</i>.</p> <p>As an example, the value reported for <code>version</code> for a <i>Response Document</i> that was structured based on <i>schema</i> revision 10 associated with Version 1.4.0 of the MTConnect Standard would be: 1.4.0.10</p> <p><code>version</code> is a required attribute.</p> | 1 |
| creationTime | <p><code>creationTime</code> represents the time that an <i>Agent</i> published the <i>Response Document</i>.</p> <p><code>creationTime</code> MUST be reported in UTC (Coordinated Universal Time) format; e.g., "2010-04-01T21:22:43Z".</p> <p>Note: Z refers to UTC/GMT time, not local time.</p> <p><code>creationTime</code> is a required attribute.</p> | 1 |

| Continuation of Table 8 | | |
|-------------------------|--|------------|
| Attribute | Description | Occurrence |
| testIndicator | <p>A flag indicating that the <i>Agent</i> that published the <i>Response Document</i> is operating in a test mode. The contents of the <i>Response Document</i> may not be valid and SHOULD be used for testing and simulation purposes only.</p> <p>The values reported for testIndicator are:</p> <ul style="list-style-type: none"> - true: The <i>Agent</i> is functioning in a test mode. - false: The <i>Agent</i> is not functioning in a test mode. <p>If testIndicator is not specified, the value for testIndicator MUST be interpreted to be false.</p> <p>testIndicator is an optional attribute.</p> | 0..1 |
| instanceId | <p>A number indicating a specific instantiation of the <i>buffer</i> associated with the <i>Agent</i> that published the <i>Response Document</i>.</p> <p>The value reported for instanceId MUST be a unique unsigned 64-bit integer.</p> <p>The value for instanceId MUST be changed to a different unique number each time the <i>buffer</i> is cleared and a new set of data begins to be collected.</p> <p>instanceId is a required attribute.</p> | 1 |

| Continuation of Table 8 | | |
|-------------------------|--|------------|
| Attribute | Description | Occurrence |
| sender | <p>An identification defining where the <i>Agent</i> that published the <i>Response Document</i> is installed or hosted.</p> <p>The value reported for <code>sender</code> MUST be either an IP Address or Hostname describing where the <i>Agent</i> is installed or the URL of the <i>Agent</i>; e.g., <code>http://<address>[:port]/</code>.</p> <p>Note: The port number need not be specified if it is the default HTTP port 80.</p> <p><code>sender</code> is a required attribute.</p> | 1 |
| bufferSize | <p>A value representing the maximum number of <i>Data Entities</i> that MAY be retained in the <i>Agent</i> that published the <i>Response Document</i> at any point in time.</p> <p>The value reported for <code>bufferSize</code> MUST be a number representing an unsigned 32-bit integer.</p> <p><code>bufferSize</code> is a required attribute.</p> <p>Note 1: <code>bufferSize</code> represents the maximum number of sequence numbers that MAY be stored in the <i>Agent</i>.</p> <p>Note 2: The implementer is responsible for allocating the appropriate amount of storage capacity required to accommodate the <code>bufferSize</code>.</p> | 1 |
| deviceModelChangeTime | <p>A timestamp in 8601 format of the last update of the <i>Device</i> information for any device.</p> | 1 |

1809 *Example 6* is an example of a Header XML element for an *MTCConnectErrors Response*
1810 *Document*:

Example 6: Example of Header XML Element for MTConnectError

```

1811 1 <Header creationTime="2017-02-16T16:44:27Z"
1812 2   sender="MyAgent" instanceId="1268463594"
1813 3   bufferSize="131072" version="1.4.0.10"/>

```

1814 6.6 Document Body

1815 The *Document Body* contains the information that is published by an *Agent* in response
 1816 to a *Request* from a client software application. Each *Response Document* has a different
 1817 XML element that represents the *Document Body*.

1818 The structure of the content of the XML element representing the *Document Body* is de-
 1819 fined by the *semantic data models* defined for each *Response Document*.

1820 *Table 9* defines the relationship between each of the *Response Documents*, the XML ele-
 1821 ment that represents the *Document Body* for each document, and the *semantic data model*
 1822 that defines the structure for the content of each of the *Response Documents*:

Table 9: Relationship between Response Document and Semantic Data Model

| Response Document | XML Element for Document Body | Semantic Data Model |
|---|-------------------------------|---|
| <i>MTConnectDevices Response Document</i> | Devices | <i>MTConnect Standard: Part 2.0 - Devices Information Model</i> |
| <i>MTConnectStreams Response Document</i> | Streams | <i>MTConnect Standard: Part 3.0 - Streams Information Model</i> |
| <i>MTConnectAssets Response Document</i> | Assets | <i>MTConnect Standard: Part 4.0 - Assets Information Model</i> |

| Continuation of Table 9 | | |
|--|--|--|
| Response Document | XML Element for Document Body | Semantic Data Model |
| <i>MTConnectErrors Response Document</i> | Errors Note: Errors MUST NOT be used when backwards compatibility with MTConnect Standard Version 1.0.1 and earlier is required. | <i>MTConnect Standard Part 1.0 - Overview and Fundamentals</i> |

1823 6.7 Extensibility

1824 MTConnect is an extensible standard, which means that implementers **MAY** extend the
 1825 *Data Models* defined in the various sections of the MTConnect Standard to include in-
 1826 formation required for a specific implementation. When these *Data Models* are encoded
 1827 using XML, the methods for extending these *Data Models* are defined by the rules estab-
 1828 lished for extending any XML schema (see the W3C website for more details on extending
 1829 XML data models).

1830 The following are typical extensions that **MAY** be considered in the MTConnect *Data*
 1831 *Models*:

- 1832 • Additional `type` and `subType` values for *Data Entities*.
- 1833 • Additional *Structural Elements* as containers.
- 1834 • Additional Composition elements.
- 1835 • New *Asset* types that are sub-typed from the abstract *Asset* type.
- 1836 • *Child Elements* that may be added to specific XML elements contained within the
 1837 *MTConnect Information Models*. These extended elements **MUST** be identified in
 1838 a separate *namespace*.

1839 When extending an MTConnect *Data Model*, there are some basic rules restricting changes
1840 to the MTConnect *Data Models*.

1841 When extending an MTConnect *Data Model*, an implementer:

- 1842 • **MUST NOT** add new value for category for *Data Entities*,
- 1843 • **MUST NOT** add new *Root Elements*,
- 1844 • **SHOULD NOT** add new *Top Level Components*, and
- 1845 • **MUST NOT** add any new attributes or include any sub-elements to *Composi-*
1846 *tion*.

1847 Note: Throughout the documents additional information is provided where
1848 extensibility may be acceptable or unacceptable to maintain compliance with
1849 the MTConnect Standard.

1850 When a *schema* representing a *Data Model* is extended, the *schema* and *namespace* dec-
1851 laration at the beginning of the corresponding *Response Document* **MUST** be updated to
1852 reflect the new *schema* and *namespace* so that a client software application can properly
1853 validate the *Response Document*.

1854 An XML example of a *schema* and *namespace* declaration, including an extended *schema*
1855 and *namespace*, is shown in *Example 7*:

Example 7: Example of extended schema and namespace in declaration

```
1856 1 <?xml version="1.0" encoding="UTF-8"?>
1857 2 <MTConnectDevices
1858 3   xmlns:xsi=http://www.w3.org/2001/XMLSchema-instance
1859 4   xmlns="urn:mtconnect.org:MTConnectDevices:1.3"
1860 5   xmlns:m="urn:mtconnect.org:MTConnectDevices:1.3"
1861 6   xmlns:x="urn:MyLocation:MyFile:MyVersion"
1862 7   xsi:schemaLocation="urn:MyLocation:MyFile:MyVersion
1863 8   /schemas/MyFileName.xsd" />
```

1864 In this example:

- 1865 • `xmlns:x` is added in Line 6 to identify the *XML Schema* instance for the extended
1866 *schema*. *Element Names* identified with an "x" prefix are associated with this spe-
1867 cific *XML Schema* instance.

1868 Note: The "x" prefix **MAY** be replaced with any prefix that the implementer
1869 chooses for identifying the extended *schema* and *namespace*.

1870 • `xsi:schemaLocation` is modified in Line 7 to associate the *namespace* URN
1871 with the URL specifying the location of *schema* file.

1872 • `MyLocation`, `MyFile`, `MyVersion`, and `MyFileName` in Lines 6 and 7 **MUST**
1873 be replaced by the actual name, version, and location of the extended *schema*.

1874 When an extended *schema* is implemented, each *Structural Element*, *Data Entity*, and
1875 *MTCConnect Asset* defined in the extended *schema* **MUST** be identified in each respective
1876 *Response Document* by adding a prefix to the *XML Element Name* associated with that
1877 *Structural Element*, *Data Entity*, or *MTCConnect Asset*. The prefix identifies the *schema*
1878 and *namespace* where that XML Element is defined.

1879 7 Protocol and Messaging

1880 An *Agent* performs two *major* communications tasks. It collects information from pieces
 1881 of equipment and it publishes MTConnect *Response Documents* in response to *Requests*
 1882 from client software applications.

1883 The MTConnect Standard does not address the method used by an *Agent* to collect in-
 1884 formation from a piece of equipment. The relationship between the *Agent* and a piece of
 1885 equipment is implementation dependent. The *Agent* may be fully integrated into the piece
 1886 of equipment or the *Agent* may be independent of the piece of equipment. Implementation
 1887 of the relationship between a piece of equipment and an *Agent* is the responsibility of the
 1888 supplier of the piece of equipment and/or the implementer of the *Agent*.

1889 The communications mechanism between an *Agent* and a client software application re-
 1890 quires the following primary components:

1891 • *Physical Connection*: The network transmission technologies that physically inter-
 1892 connect an *Agent* and a client software application. Examples of a *Physical Con-*
 1893 *nection* would be an Ethernet network or a wireless connection.

1894 • *Transport Protocol*: A set of capabilities that provide the rules and procedures used
 1895 to transport information between an *Agent* and a client software application through
 1896 a *Physical Connection*.

1897 • *Application Programming Interface*: The *Request* and *Response* interactions that
 1898 occur between an *Agent* and a client software application.

1899 • *Message*: The content of the information that is exchanged. The *Message* includes
 1900 both the content of the MTConnect *Response Document* and any additional informa-
 1901 tion required for the client software application to interpret the *Response Document*.

1902 Note: The *Physical Connections*, *Transport Protocols*, and *Application Pro-*
 1903 *gramming Interface* supported by an *Agent* are independent of the *Message* it-
 1904 self; i.e., the information contained in the MTConnect *Response Documents* is
 1905 not changed based on the methods used to transport those documents to a client
 1906 software application.

1907 An *Agent* **MAY** support multiple methods for communicating with client software ap-
 1908 plications. The MTConnect Standard specifies one methodology for communicating that
 1909 **MUST** be supported by every *Agent*. This methodology is a REST, which defines a state-
 1910 less, client-server communications architecture. This REST interface is the architectural
 1911 pattern that specifies the exchange of information between an *Agent* and a client software

1912 application. REST dictates that a server has no responsibility for tracking or coordinating
1913 with a client software application regarding which information or how much information
1914 the client software application may request from a server. This removes the burden for
1915 a server to keep track of client sessions. An *Agent* **MUST** be implemented as a server
1916 supporting the RESTful interface.

1917 8 HTTP Messaging Supported by an Agent

1918 This section describes the application of *HTTP Messaging* applied to a REST interface that
1919 **MUST** be supported by an *Agent* to realize the *MTConnect Request/Response* information
1920 exchange functionality.

1921 8.1 REST Interface

1922 An *Agent* **MUST** provide a REST interface that supports HTTP version 1.0 to commu-
1923 nicate with client applications. This interface **MUST** support HTTP (RFC7230) and use
1924 URIs (RFC3986) to identify specific information requested from an *Agent*. HTTP is most
1925 often implemented on top of the Transmission Control Protocol (TCP) that provides an
1926 ordered byte stream of data and the Internet Protocol (IP) that provides unified address-
1927 ing and routing between computers. However, additional interfaces to an *Agent* may be
1928 implemented in conjunction with any other communications technologies.

1929 The REST interface supports an *Application Programming Interface* (API) that adheres
1930 to the architectural principles of a stateless, uniform interface to retrieve data and other
1931 information related to either pieces of equipment or *MTConnect Assets*. The API allows
1932 for access, but not modification of data stored within the *Agent* and is nullipotent, meaning
1933 it will not produce any side effects on the information stored in an *Agent* or the function
1934 of the *Agent* itself.

1935 *HTTP Messaging* is comprised of two basic functions – an *HTTP Request* and an *HTTP*
1936 *Response*. A client software application forms a *Request* for information from an *Agent*
1937 by specifying a specific set of information using an *HTTP Request*. In response, an *Agent*
1938 provides either an *HTTP Response* or replies with an *HTTP Error Message* as defined
1939 below.

1940 8.2 HTTP Request

1941 The *MTConnect Standard* defines that an *Agent* **MUST** support the HTTP GET verb – no
1942 other HTTP methods are required to be supported.

1943 An *HTTP Request* **MAY** include three sections:

- 1944 • an *HTTP Request Line*
- 1945 • *HTTP Header Fields*

- 1946 • an *HTTP Body*

1947 The MTConnect Standard defines that an *HTTP Request* issued by a client application
1948 **SHOULD** only have two sections:

- 1949 • an *HTTP Request Line*
1950 • *HTTP Header Fields*

1951 The *HTTP Request Line* identifies the specific information being requested by the client
1952 software application. If an *Agent* receives any information in an *HTTP Request* that is not
1953 specified in the MTConnect Standard, the *Agent* **MAY** ignore it.

1954 The structure of an *HTTP Request Line* consists of the following portions:

- 1955 • *HTTP Request Method*: GET
1956 • *HTTP Request URL*: `http://<authority>/<path>[?<query>]`
1957 • *HTTP Version*: HTTP/1.0

1958 For the following discussion, the *HTTP Request URL* will only be considered since the
1959 Method will always be GET and the MTConnect Standard only requires HTTP/1.0.

1960 **8.2.1 authority Portion of an HTTP Request Line**

1961 The *authority* portion consists of the DNS name or IP address associated with an
1962 *Agent* and an optional TCP port number [`:port`] that the *Agent* is listening to for incoming
1963 *Requests* from client software applications. If the port number is the default Port 80, `port`
1964 is not required.

1965 Example forms for *authority* are:

- 1966 • `http://machine/`
1967 • `http://machine:5000/`
1968 • `http://192.168.1.2:5000/`

1969 8.2.2 path Portion of an HTTP Request Line

1970 The <Path> portion of the *HTTP Request Line* has the follow segments:

- 1971 • /<name or uuid>/<request>

1972 In this portion of the *HTTP Request Line*, name or uuid designates that the information to
 1973 be returned in a *Response Document* is associated with a specific piece of equipment that
 1974 has published data to the *Agent*. See Part 2 - *Devices Information Model* for details on
 1975 name or uuid for a piece of equipment.

1976 Note: If name or uuid are not specified in the *HTTP Request Line*, an *Agent* **MUST**
 1977 return the information for all pieces of equipment that have published data to
 1978 the *Agent* in the *Response Document*.

1979 In the <Path> portion of the *HTTP Request Line*, <request> designates one of the
 1980 *Requests* defined in *Section 5.4 - Request/Response Information Exchange*. The value
 1981 for <request> **MUST** be probe, current, sample, or asset(s) representing the
 1982 *Probe Request*, *Current Request*, *Sample Request*, and *Asset Request* respectively.

1983 8.2.3 query Portion of an HTTP Request Line

1984 The [?<query>] portion of the *HTTP Request Line* designates an HTTP *Query*. *Query* is
 1985 a string of parameters that define filters used to refine the content of a *Response Document*
 1986 published in response to an *HTTP Request*.

1987 8.3 MTConnect Request/Response Information Exchange Implemented 1988 with HTTP

1989 An *Agent* **MUST** support *Probe Requests*, *Current Requests*, *Sample Requests*, and *Asset*
 1990 *Requests*.

1991 The following sections define how the *HTTP Request Line* is structured to support each of
 1992 these types of *Requests* and the information that an *Agent* **MUST** provide in response to
 1993 these *Requests*.

1994 8.3.1 Probe Request Implemented Using HTTP

1995 An *Agent* responds to a *Probe Request* with an *MConnectDevices Response Document*
 1996 that contains the *Equipment Metadata* for pieces of equipment that are requested and cur-
 1997 rently represented in the *Agent*.

1998 There are two forms of the *Probe Request*:

1999 • The first form includes an *HTTP Request Line* that does not specify a specific path
 2000 portion (name or uuid). In response to this *Request*, the *Agent* returns an *MT-*
 2001 *ConnectDevices Response Document* with information for all pieces of equipment
 2002 represented in the *Agent*.

2003 1. http://<authority>/probe

2004 • The second form includes an *HTTP Request Line* that specifies a specific path por-
 2005 tion that defines either a name or uuid. In response to this *Request*, the *Agent*
 2006 returns an *MConnectDevices Response Document* with information for only the
 2007 one piece of equipment associated with that name or uuid.

2008 1. http://<authority>/<name or uuid>/probe

2009 8.3.1.1 Path Portion of the HTTP Request Line for a Probe Request

2010 The following segments of path **MUST** be supported in an *HTTP Request Line* for a
 2011 *Probe Request*:

Table 10: Path of the HTTP Request Line for a Probe Request

| Path Segments | Description |
|---------------|--|
| name or uuid | If present, specifies that only the <i>Equipment Metadata</i> for the piece of equipment represented by the name or uuid will be published. If not present, <i>Metadata</i> for all pieces of equipment associated with the <i>Agent</i> will be published. |
| <request> | probe MUST be provided. |

2012 8.3.1.2 Query Portion of the HTTP Request Line for a Probe Request

2013 The *HTTP Request Line* for a *Probe Request* **SHOULD NOT** contain a query. If the

2014 *Request* does contain a query, the *Agent* **MUST** ignore the query.

2015 **8.3.1.3 Response to a Probe Request**

2016 The *Response* to a *Probe Request* **SHOULD** be an *MtConnectDevices Response Document* for one or more pieces of equipment as designated by the path portion of the
2017 *Request*.
2018

2019 The *Response Document* returned in response to a *Probe Request* **MUST** always provide
2020 the most recent information available to an *Agent*.

2021 The *Response* **MUST** also include an *HTTP Status Code*. If problems are encountered by
2022 an *Agent* while responding to a *Probe Request*, the *Agent* **MUST** also publish an *MtConnectErrors Response Document*.
2023

2024 **8.3.1.4 HTTP Status Codes for a Probe Request**

2025 The following *HTTP Status Codes* **MUST** be supported as possible responses to a *Probe*
2026 *Request*:

Table 11: HTTP Status Codes for a Probe Request

| HTTP Status Code | Code Name | Description |
|------------------|-------------|--|
| 200 | OK | The <i>Request</i> was handled successfully. |
| 400 | Bad Request | The <i>Request</i> could not be interpreted. The <i>Agent</i> MUST return a 400 <i>HTTP Status Code</i> . Also, the <i>Agent</i> MUST publish an <i>MtConnectErrors Response Document</i> that identifies either <code>INVALID_URI</code> or <code>INVALID_REQUEST</code> as the <code>errorCode</code> . |
| 404 | Not Found | The <i>Request</i> could not be interpreted. The <i>Agent</i> MUST return a 404 <i>HTTP Status Code</i> . Also, the <i>Agent</i> MUST publish an <i>MtConnectErrors Response Document</i> that identifies <code>NO_DEVICE</code> as the <code>errorCode</code> . |

| Continuation of Table 11 | | |
|--------------------------|---------------------------------|---|
| HTTP Status Code | Code Name | Description |
| 405 | Method Not Allowed | <p>A method other than GET was specified in the <i>Request</i> or the piece of equipment specified in the <i>Request</i> could not be found.</p> <p>The <i>Agent</i> MUST return a 405 <i>HTTP Status Code</i>. Also, the <i>Agent</i> MUST publish an <i>MTCConnectErrors Response Document</i> that identifies UNSUPPORTED as the <code>errorCode</code>.</p> |
| 406 | Not Acceptable | <p>The <i>HTTP Accept Header</i> in the <i>Request</i> was not one of the supported representations.</p> <p>The <i>Agent</i> MUST return a 406 <i>HTTP Status Code</i>. Also, the <i>Agent</i> MUST publish an <i>MTCConnectErrors Response Document</i> that identifies UNSUPPORTED as the <code>errorCode</code>.</p> |
| 431 | Request Header Fields Too Large | <p>The fields in the <i>HTTP Request</i> exceed the limit of the implementation of the <i>Agent</i>.</p> <p>The <i>Agent</i> MUST return a 431 <i>HTTP Status Code</i>. Also, the <i>Agent</i> MUST publish an <i>MTCConnectErrors Response Document</i> that identifies INVALID_REQUEST as the <code>errorCode</code>.</p> |
| 500 | Internal Server Error | <p>There was an unexpected error in the <i>Agent</i> while responding to a <i>Request</i>.</p> <p>The <i>Agent</i> MUST return a 500 <i>HTTP Status Code</i>. Also, the <i>Agent</i> MUST publish an <i>MTCConnectErrors Response Document</i> that identifies INTERNAL_ERROR as the <code>errorCode</code>.</p> |

2027 8.3.2 Current Request Implemented Using HTTP

2028 An *Agent* responds to a *Current Request* with an *MTCConnectStreams Response Document*
 2029 that contains the current value of *Data Entities* associated with each piece of *Streaming*
 2030 *Data* available from the *Agent*, subject to any filtering defined in the *Request*.

2031 There are two forms of the *Current Request*:

2032 • The first form is given without a specific path portion (*name* or *uuid*). In response
 2033 to this *Request*, the *Agent* returns an *MTCConnectStreams Response Document* with
 2034 information for all pieces of equipment represented in the *buffer* of the *Agent*.

2035 1. `http://<authority>/current[?query]`

2036 • The second form includes a specific path portion that defines either a *name* or *uuid*.
 2037 In response to this *Request*, the *Agent* returns an *MTCConnectStreams Response Doc-*
 2038 *ument* with information for only the one piece of equipment associated with the
 2039 *name* or *uuid* defined in the *Request*.

2040 1. `http://<authority>/<name or uuid>/current[?query]`

2041 8.3.2.1 Path Portion of the HTTP Request Line for a Current Request

2042 The following segments of path **MUST** be supported for an *HTTP Request Line* for a
 2043 *Current Request*:

Table 12: Path of the HTTP Request Line for a Current Request

| Path Segments | Description |
|--|--|
| <code>name</code> or <code>uuid</code> | If present, specifies that only the <i>Equipment Metadata</i> for the piece of equipment represented by the <code>name</code> or <code>uuid</code> will be published. If not present, <i>Metadata</i> for all pieces of equipment associated with the <i>Agent</i> will be published. |
| <code><request></code> | <code>current</code> MUST be provided. |

2044 8.3.2.2 Query Portion of the HTTP Request Line for a Current Request

2045 A *Query* may be used to more precisely define the specific information to be included
 2046 in a *Response Document*. Multiple parameters may be used in a *Query* to further refine

2047 the information to be included. When multiple parameters are provided, each parameter
 2048 is separated by an ampersand (&) character and each parameter appears only once in the
 2049 *Query*. The parameters within the *Query* may appear in any sequence.

2050 The following query parameters **MUST** be supported in an *HTTP Request Line* for a
 2051 *Current Request*:

Table 13: Query Parameters of the HTTP Request Line for a Current Request

| Query Parameters | Description |
|------------------|---|
| path | <p>An XPath that defines specific information or a set of information to be included in an <i>MTCConnectStreams Response Document</i>.</p> <p>The value for the XPath is the location of the information defined in the <i>Devices Information Model</i> that represents the <i>Structural Element(s)</i> and/or the specific <i>Data Entities</i> to be included in the <i>MTCConnectStreams Response Document</i> .</p> <p>When a <i>Component</i> element is referenced by the XPath, all <i>Lower Level</i> components and the <i>Data Entities</i> associated with those elements MUST be included in the <i>MTCConnectStreams Response Document</i>.</p> |

| Continuation of Table 13 | |
|--------------------------|--|
| Query Parameters | Description |
| at | <p>Requests that the <i>MTConnect Response Documents</i> MUST include the current value for all <i>Data Entities</i> relative to the time that a specific <i>sequence number</i> was recorded.</p> <p>The value associated with the <code>at</code> parameter references a specific <i>sequence number</i>. The value MUST be an unsigned 64-bit value.</p> <p>The <code>at</code> parameter MUST NOT be used in conjunction with the <code>interval</code> parameter since this would cause an <i>Agent</i> to repeatedly return the same data.</p> <p>If the value provided for the <code>at</code> parameter is a negative number or is not a, the <i>Request</i> MUST be determined to be invalid. The <i>Agent</i> MUST return a 400 <i>HTTP Status Code</i>. Also, the <i>Agent</i> MUST publish an <i>MTConnectErrors Response Document</i> that identifies an <code>INVALID_REQUEST</code> <code>errorCode</code>.</p> <p>If the value provided for the <code>at</code> parameter is either lower than the value of <code>firstSequence</code> or greater than the value of <code>lastSequence</code>, the <i>Request</i> MUST be determined to be invalid. The <i>Agent</i> MUST return a 404 <i>HTTP Status Code</i>. The <i>Agent</i> MUST also publish an <i>MTConnectErrors Response Document</i> that identifies an <code>OUT_OF_RANGE</code> <code>errorCode</code>.</p> <p>Note: Some information stored in the <i>buffer</i> of an <i>Agent</i> may not be returned for a <i>Current Request</i> with a <i>Query</i> containing an <code>at</code> parameter if the <i>sequence number</i> associated with the most current value for that information is greater than the <i>sequence number</i> specified in the <i>Query</i>.</p> |
| interval | <p>The <i>Agent</i> MUST continuously publish <i>Response Documents</i> when the query parameters include <code>interval</code> using the value as the period between adjacent publications.</p> <p>The <code>interval</code> value MUST be in milliseconds, and MUST be a positive integer greater than zero (0).</p> <p>The <i>Query</i> MUST NOT specify both <code>interval</code> and <code>at</code> parameters.</p> |

2052 **8.3.2.3 Response to a Current Request**

2053 The *Response* to a *Current Request* **SHOULD** be an *MTCConnectStreams Response Document* for one or more pieces of equipment designated by the `path` portion of the *Request*.

2055 The *Response* to a *Current Request* **MUST** always provide the most recent information
2056 available to an *Agent* or, when the `at` parameter is specified, the value of the data at the
2057 given *sequence number*.

2058 The *Data Entities* provided in the *MTCConnectStreams Response Document* will be limited
2059 to those specified in the combination of the `path` segment of the *Current Request* and the
2060 value of the XPath defined for the `path` attribute provided in the `query` segment of that
2061 *Request*.

2062 8.3.2.4 HTTP Status Codes for a Current Request

2063 The following *HTTP Status Codes* **MUST** be supported as possible responses to a *Current*
2064 *Request*:

Table 14: HTTP Status Codes for a Current Request

| HTTP Status Code | Code Name | Description |
|------------------|-------------|--|
| 200 | OK | The <i>Request</i> was handled successfully. |
| 400 | Bad Request | <p>The <i>Request</i> could not be interpreted.</p> <p>The <i>Agent</i> MUST return a 400 <i>HTTP Status Code</i>. Also, the <i>Agent</i> MUST publish an <i>MTCConnectErrors Response Document</i> that identifies either <code>INVALID_URI</code>, <code>INVALID_REQUEST</code>, or <code>INVALID_XPATH</code> as the <code>errorCode</code>.</p> <p>If the <code>query</code> parameters do not contain a valid value or include an invalid parameter, the <i>Agent</i> MUST return a 400 <i>HTTP Status Code</i>. Also, the <i>Agent</i> MUST publish an <i>MTCConnectErrors Response Document</i> that identifies <code>QUERY_ERROR</code> as the <code>errorCode</code>.</p> |

| Continuation of Table 14 | | |
|--------------------------|---------------------------------|---|
| HTTP Status Code | Code Name | Description |
| 404 | Not Found | <p>The <i>Request</i> could not be interpreted.</p> <p>The <i>Agent</i> MUST return a 404 <i>HTTP Status Code</i>. Also, the <i>Agent</i> MUST publish an <i>MConnectErrors Response Document</i> that identifies NO_DEVICE as the <code>errorCode</code>.</p> <p>If the value of the <code>at</code> parameter was greater than the <code>lastSequence</code> or is less than the <code>firstSequence</code>, the <i>Agent</i> MUST return a 404 <i>HTTP Status Code</i>. Also, the <i>Agent</i> MUST publish an <i>MConnectErrors Response Document</i> that identifies OUT_OF_RANGE as the <code>errorCode</code>.</p> |
| 405 | Method Not Allowed | <p>A method other than GET was specified in the <i>Request</i> or the piece of equipment specified in the <i>Request</i> could not be found.</p> <p>The <i>Agent</i> MUST return a 405 <i>HTTP Status Code</i>. Also, the <i>Agent</i> MUST publish an <i>MConnectErrors Response Document</i> that identifies UNSUPPORTED as the <code>errorCode</code>.</p> |
| 406 | Not Acceptable | <p>The <i>HTTP Accept Header</i> in the <i>Request</i> was not one of the supported representations.</p> <p>The <i>Agent</i> MUST return a 406 <i>HTTP Status Code</i>. Also, the <i>Agent</i> MUST publish an <i>MConnectErrors Response Document</i> that identifies UNSUPPORTED as the <code>errorCode</code>.</p> |
| 431 | Request Header Fields Too Large | <p>The fields in the <i>HTTP Request</i> exceed the limit of the implementation of the <i>Agent</i>.</p> <p>The <i>Agent</i> MUST return a 431 <i>HTTP Status Code</i>. Also, the <i>Agent</i> MUST publish an <i>MConnectErrors Response Document</i> that identifies INVALID_REQUEST as the <code>errorCode</code>.</p> |

| Continuation of Table 14 | | |
|--------------------------|-----------------------|--|
| HTTP Status Code | Code Name | Description |
| 500 | Internal Server Error | <p>There was an unexpected error in the <i>Agent</i> while responding to a <i>Request</i>.</p> <p>The <i>Agent</i> MUST return a 500 <i>HTTP Status Code</i>. Also, the <i>Agent</i> MUST publish an <i>MConnectErrors Response Document</i> that identifies INTERNAL_ERROR as the <code>errorCode</code>.</p> |

2065 8.3.3 Sample Request Implemented Using HTTP

2066 An *Agent* responds to a *Sample Request* with an *MConnectStreams Response Document*
 2067 that contains a set of values for *Data Entities* currently available for *Streaming Data* from
 2068 the *Agent*, subject to any filtering defined in the *Request*.

2069 There are two forms to the *Sample Request*:

2070 • The first form is given without a specific `path` portion (name or uuid). In re-
 2071 sponse to this *Request*, the *Agent* returns an *MConnectStreams Response Docu-*
 2072 *ment* with information for all pieces of equipment represented in the *Agent*.

2073 1. `http://<authority>/sample[?query]`

2074 • The second form includes a specific `path` portion that defines either a name or
 2075 uuid.

2076 In response to this *Request*, the *Agent* returns an *MConnectStreams Response Doc-*
 2077 *ument* with information for only the one piece of equipment associated with the
 2078 name or uuid defined in the *Request*.

2079 1. `http://<authority>/<name or uuid>/sample?query`

2080 8.3.3.1 Path Portion of the HTTP Request Line for a Sample Request

2081 The following segments of `path` **MUST** be supported in the *HTTP Request Line* for a
 2082 *Sample Request*:

Table 15: Path of the HTTP Request Line for a Sample Request

| Path Segments | Description |
|---------------|--|
| name or uuid | If present, specifies that only the <i>Equipment Metadata</i> for the piece of equipment represented by the <code>name</code> or <code>uuid</code> will be published. If not present, <i>Metadata</i> for all pieces of equipment associated with the <i>Agent</i> will be published. |
| <request> | <code>sample</code> MUST be provided. |

2083 8.3.3.2 Query Portion of the HTTP Request Line for a Sample Request

2084 A *Query* may be used to more precisely define the specific information to be included
 2085 in a *Response Document*. Multiple parameters may be used in a *Query* to further refine
 2086 the information to be included. When multiple parameters are provided, each parameter
 2087 is separated by an & character and each parameter appears only once in the *Query*. The
 2088 parameters within the *Query* may appear in any sequence.

2089 The following *query* parameters **MUST** be supported in an *HTTP Request Line* for a
 2090 *Sample Request*:

Table 16: Query Parameters of the HTTP Request Line for a Sample Request

| Query Parameters | Description |
|------------------|--|
| path | An XPath that defines specific information or a set of information to be included in an <i>MTCConnectStreams Response Document</i> . The value for the XPath is the location of the information defined in the <i>Devices Information Model</i> that represents the <i>Structural Element(s)</i> and/or the specific <i>Data Entities</i> to be included in the <i>MTCConnectStreams Response Document</i> . When a <i>Component</i> element is referenced by the XPath, all <i>Lower Level</i> components and the <i>Data Entities</i> associated with those elements MUST be included in the <i>MTCConnectStreams Response Document</i> . |

| Continuation of Table 16 | |
|--------------------------|--|
| Query Parameters | Description |
| from | <p>The <code>from</code> parameter designates the <i>sequence number</i> of the first <i>observation</i> in the <i>buffer</i> the <i>Agent</i> MUST consider publishing in the <i>Response Document</i>.</p> <p>The value of <code>from</code> MUST be an unsigned 64-bit integer.</p> <p>If <code>from</code> is zero (0), it MUST be set to the <code>firstSequence</code>, the oldest <i>observation</i> in the <i>buffer</i>.</p> <p>If <code>from</code> and <code>count</code> parameters are not given, <code>from</code> MUST default to the <code>firstSequence</code>.</p> <p>If <code>from</code> is not given and <code>count</code> parameter is given, see <code>count</code> for default behavior.</p> <p>If the <code>from</code> parameter is less than the <code>firstSequence</code> or greater than <code>lastSequence</code>, the <i>Agent</i> MUST return a 404 <i>HTTP Status Code</i> and MUST publish an <i>MTCConnectErrors Response Document</i> with an <code>OUT_OF_RANGE</code> <code>errorCode</code>.</p> <p>If the <code>from</code> parameter is not a positive numeric value, the <i>Agent</i> MUST return a 400 <i>HTTP Status Code</i> and MUST publish an <i>MTCConnectErrors Response Document</i> with an <code>INVALID_REQUEST</code> <code>errorCode</code>.</p> |

| Continuation of Table 16 | |
|--------------------------|---|
| Query Parameters | Description |
| interval | <p>The <i>Agent</i> MUST continuously publish <i>Response Documents</i> when the query parameters include <code>interval</code> using the value as the minimum period between adjacent publications.</p> <p>The <code>interval</code> value MUST be in milliseconds, and MUST be a positive integer greater than or equal to zero (0).</p> <p>The <i>Query</i> MUST NOT specify both <code>interval</code> and <code>from</code> parameters.</p> <p>If the value for the <code>interval</code> parameter is zero (0), the <i>Agent</i> MUST publish <i>Response Documents</i> at the fastest rate possible.</p> <p>If the period between the publication of a <i>Response Document</i> and reception of <i>observations</i> exceeds the <code>interval</code>, the <i>Agent</i> MUST wait for a maximum of <code>heartbeat</code> milliseconds for <i>observations</i>. Upon the arrival of <i>observations</i>, the <i>Agent</i> MUST immediately publish a <i>Response Document</i>. When the period equals or exceeds the <code>heartbeat</code>, the <i>Agent</i> MUST publish an empty <i>Response Document</i>.</p> |

| Continuation of Table 16 | |
|--------------------------|---|
| Query Parameters | Description |
| count | <p>The <code>count</code> parameter designates the maximum number of <i>observations</i> the <i>Agent</i> MUST publish in the <i>Response Document</i>.</p> <p>The value of <code>count</code> MUST be a signed integer.</p> <p>The <code>count</code> MUST NOT be zero (0).</p> <p>When the <code>count</code> is greater than zero (0), the <code>from</code> parameter MUST default to the <code>firstSequence</code>. The evaluation of <i>observations</i> starts at <code>from</code> and moves forward accumulating newer <i>observations</i> until the number of <i>observations</i> equals the <code>count</code> or the <i>observation</i> at <code>lastSequence</code> is considered.</p> <p>When the <code>count</code> is less than zero (0), the <code>from</code> parameter MUST default to the <code>lastSequence</code>. The evaluation of <i>observations</i> starts at <code>from</code> and moves backward accumulating older <i>observations</i> until the number of <i>observations</i> equals the absolute value of <code>count</code> or the <i>observation</i> at <code>firstSequence</code> is considered.</p> <p><code>count</code> MUST NOT be less than zero (0) when an <code>interval</code> parameter is given.</p> <p>If <code>count</code> is not provided, it MUST default to 100.</p> <p>If the absolute value of <code>count</code> is greater than the size of the <i>buffer</i> or equal to zero (0), the <i>Agent</i> MUST return a 404 <i>HTTP Status Code</i> and MUST publish an <i>MtConnectErrors Response Document</i> with an <code>OUT_OF_RANGE</code> <code>errorCode</code>.</p> <p>If the <code>count</code> parameter is not a numeric value, the <i>Agent</i> MUST return a 400 <i>HTTP Status Code</i> and MUST publish an <i>MtConnectErrors Response Document</i> with an <code>INVALID_REQUEST</code> <code>errorCode</code>.</p> |

| Continuation of Table 16 | |
|--------------------------|---|
| Query Parameters | Description |
| heartbeat | <p>Sets the time period for the <i>heartbeat</i> function in an <i>Agent</i>.</p> <p>The value for <code>heartbeat</code> represents the amount of time after a <i>Response Document</i> has been published until a new <i>Response Document</i> MUST be published, even when no new data is available.</p> <p>The value for <code>heartbeat</code> is defined in milliseconds.</p> <p>If no value is defined for <code>heartbeat</code>, the value SHOULD default to 10 seconds.</p> <p><code>heartbeat</code> MUST only be specified if <code>interval</code> is also specified.</p> |

| Continuation of Table 16 | |
|--------------------------|--|
| Query Parameters | Description |
| to | <p>The to parameter specifies the sequence number of the observation in the buffer that will be the upper bound of the observations in the Response Document.</p> <ul style="list-style-type: none"> • The value of to MUST be an unsigned 64-bit integer. • The value of to MUST be greater than the firstSequence. • The value of to MUST be less than or equal to the lastSequence. • The value of to MUST be greater than from. • If to and count are given, the count parameter MUST be greater than zero. • If to and count are given, the maximum number of <i>observations</i> published in the <i>Response Document</i> MUST NOT be greater than the value of count. • If to is not given, see the from parameter for default behavior. • If the to parameter is less than the firstSequence or greater than lastSequence, the <i>Agent</i> MUST return a 404 <i>HTTP Status Code</i> and MUST publish an <i>MTCConnectErrors Response Document</i> with an OUT_OF_RANGE errorCode. • If the to parameter is not a positive numeric value, the <i>Agent</i> MUST return a 400 <i>HTTP Status Code</i> and MUST publish an <i>MTCConnectErrors Response Document</i> with an INVALID_REQUEST errorCode. |

| Continuation of Table 16 | |
|----------------------------|---|
| Query Parameters | Description |
| t _o (continued) | <ul style="list-style-type: none"> • If the t_o parameter is less than the from parameter, the Agent MUST return a 400 <i>HTTP Status Code</i> and MUST publish an <i>MTCConnectErrors Response Document</i> with an INVALID_REQUEST errorCode. • If the t_o parameter is given and the count parameter is less than zero, the Agent MUST return a 400 <i>HTTP Status Code</i> and MUST publish an <i>MTCConnectErrors Response Document</i> with an INVALID_REQUEST errorCode. |

2091 8.3.3.3 Response to a Sample Request

2092 The *Response* to a *Sample Request* **SHOULD** be an *MTCConnectStreams Response Document* for one or more pieces of equipment designated by the path portion of the *Request*.

2094 The *Response* to a *Sample Request* **MUST** always provide the most recent information available to an *Agent* or, when the at parameter is specified, the value of the data at the given *sequence number*.

2097 The *Data Entities* provided in the *MTCConnectStreams Response Document* will be limited to those specified in the combination of the path segment of the *Sample Request* and the value of the XPath defined for the path attribute provided in the query segment of that *Request*.

2101 When the value of from references the value of the next *sequence number* (nextSequence) and there are no additional *Data Entities* available in the buffer, the response document will have an empty <Streams/> element in the MTCConnectStreams document to indicate no data is available at the point in time that the *Agent* published the *Response Document*.

2106 8.3.3.4 HTTP Status Codes for a Sample Request

2107 The following *HTTP Status Codes* **MUST** be supported as possible responses to a *Sample Request*:

Table 17: HTTP Status Codes for a Sample Request

| HTTP Status Code | Code Name | Description |
|------------------|--------------------|--|
| 200 | OK | The <i>Request</i> was handled successfully. |
| 400 | Bad Request | <p>The <i>Request</i> could not be interpreted.</p> <p>The <i>Agent</i> MUST return a 400 <i>HTTP Status Code</i>. Also, the <i>Agent</i> MUST publish an <i>MConnectErrors Response Document</i> that identifies either <code>INVALID_URI</code>, <code>INVALID_REQUEST</code>, or <code>INVALID_XPATH</code> as the <code>errorCode</code>.</p> <p>If the <code>query</code> parameters do not contain a valid value or include an invalid parameter, the <i>Agent</i> MUST return a 400 <i>HTTP Status Code</i>. Also, the <i>Agent</i> MUST publish an <i>MConnectErrors Response Document</i> that identifies <code>QUERY_ERROR</code> as the <code>errorCode</code>.</p> |
| 404 | Not Found | <p>The <i>Request</i> could not be interpreted.</p> <p>The <i>Agent</i> MUST return a 404 <i>HTTP Status Code</i>. Also, the <i>Agent</i> MUST publish an <i>MConnectErrors Response Document</i> that identifies <code>NO_DEVICE</code> as the <code>errorCode</code>.</p> <p>If the value of the <code>at</code> parameter was greater than the <code>lastSequence</code> or is less than the <code>firstSequence</code>, the <i>Agent</i> MUST return a 404 <i>HTTP Status Code</i>. Also, the <i>Agent</i> MUST publish an <i>MConnectErrors Response Document</i> that identifies <code>OUT_OF_RANGE</code> as the <code>errorCode</code>.</p> |
| 405 | Method Not Allowed | <p>A method other than <code>GET</code> was specified in the <i>Request</i> or the piece of equipment specified in the <i>Request</i> could not be found.</p> <p>The <i>Agent</i> MUST return a 405 <i>HTTP Status Code</i>. Also, the <i>Agent</i> MUST publish an <i>MConnectErrors Response Document</i> that identifies <code>UNSUPPORTED</code> as the <code>errorCode</code>.</p> |

| Continuation of Table 17 | | |
|--------------------------|---------------------------------|---|
| HTTP Status Code | Code Name | Description |
| 406 | Not Acceptable | The <i>HTTP Accept Header</i> in the <i>Request</i> was not one of the supported representations. The <i>Agent</i> MUST return a 406 <i>HTTP Status Code</i> . Also, the <i>Agent</i> MUST publish an <i>MConnectErrors Response Document</i> that identifies UNSUPPORTED as the <code>errorCode</code> . |
| 431 | Request Header Fields Too Large | The fields in the <i>HTTP Request</i> exceed the limit of the implementation of the <i>Agent</i> . The <i>Agent</i> MUST return a 431 <i>HTTP Status Code</i> . Also, the <i>Agent</i> MUST publish an <i>MConnectErrors Response Document</i> that identifies INVALID_REQUEST as the <code>errorCode</code> . |
| 500 | Internal Server Error | There was an unexpected error in the <i>Agent</i> while responding to a <i>Request</i> . The <i>Agent</i> MUST return a 500 <i>HTTP Status Code</i> . Also, the <i>Agent</i> MUST publish an <i>MConnectErrors Response Document</i> that identifies INTERNAL_ERROR as the <code>errorCode</code> . |

2109 8.3.4 Asset Request Implemented Using HTTP

2110 An *Agent* responds to an *Asset Request* with an *MConnectAssets Response Document*
2111 that contains information for *MConnect Assets* from the *Agent*, subject to any filtering
2112 defined in the *Request*.

2113 There are multiple forms to the *Asset Request*:

- 2114 • The first form is given without a specific path portion (name or uuid). In re-
2115 sponse to this *Request*, the *Agent* returns an *MConnectAssets Response Document*
2116 that contains information for all *Asset Document* represented in the *Agent*.

2117 1. `http://<authority>/assets`

- 2118 • The second form includes a specific path portion that defines the identity (as-
 2119 set_id) for one or more specific *Asset Documents*. In response to this *Request*,
 2120 the *Agent* returns an *MTConnectAssets Response Document* that contains informa-
 2121 tion for the specific Assets represented in the *Agent* and defined by each of the
 2122 asset_id values provided in the *Request*. Each asset_id is separated by a ";".
 2123 1. http://<authority>/asset/asset_id;asset_id;asset_id....

2124 Note: An *HTTP Request Line* may include combinations of path and query to
 2125 achieve the desired set of *Asset Documents* to be included in a specific *MT-*
 2126 *ConnectAssets Response Document*.

2127 8.3.4.1 Path Portion of the HTTP Request Line for an Asset Request

2128 The following segments of path **MUST** be supported in the *HTTP Request Line* for an
 2129 *Asset Request*:

Table 18: Path of the HTTP Request Line for an Asset Request

| Path Segments | Description |
|---------------|--|
| <request> | asset or assets MUST be provided. |
| asset_id | Identifies the id attribute of an <i>MTConnect Asset</i> to be provided by an <i>Agent</i> . |

2130 8.3.4.2 Query Portion of the HTTP Request Line for an Asset Request

2131 A *Query* may be used to more precisely define the specific information to be included
 2132 in a *Response Document*. Multiple parameters may be used in a *Query* to further refine
 2133 the information to be included. When multiple parameters are provided, each parameter
 2134 is separated by an & character and each parameter appears only once in the *Query*. The
 2135 parameters within the *Query* may appear in any sequence.

2136 The following query parameters **MUST** be supported in an *HTTP Request Line* for an
 2137 *Asset Request*:

Table 19: Query Parameters of the HTTP Request Line for an Asset Request

| Query Parameters | Description |
|------------------|---|
| type | <p>Defines the type of <i>MTCConnect Asset</i> to be returned in the <i>MTCConnectAssets Response Document</i>.</p> <p>The type for an <i>Asset</i> is the term used in the <i>Asset Information Model</i> to describe different types of <i>Assets</i>. It is the term that is substituted for the <code>Asset</code> container and describes the highest-level element in the <i>Asset</i> hierarchy. See <i>MTCConnect Standard: Part 4.0 - Assets Information Model, Section 3.2.3</i> for more information on the type of an <i>Asset</i>.</p> |
| removed | <p><i>Assets</i> can have an attribute that indicates whether the <i>Asset</i> has been removed from a piece of equipment.</p> <p>The valid values for <code>removed</code> are <code>true</code> or <code>false</code>.</p> <p>If the value of the <code>removed</code> parameter in the <code>query</code> is <code>true</code>, then <i>Asset Documents</i> for <i>Assets</i> that have been marked as removed from a piece of equipment will be included in the <i>Response Document</i>.</p> <p>If the value of the <code>removed</code> parameter in the <code>query</code> is <code>false</code>, then <i>Asset Documents</i> for <i>Assets</i> that have been marked as removed from a piece of equipment will not be included in the <i>Response Document</i>.</p> <p>If <code>removed</code> is not defined in a <code>query</code>, the default value for <code>removed</code> MUST be determined to be <code>false</code>.</p> |
| count | <p>Defines the maximum number of <i>Asset Documents</i> to return in an <i>MTCConnectAssets Response Document</i>.</p> <p>If <code>count</code> is not defined in the <code>query</code>, the default value for <code>count</code> MUST be determined to be 100.</p> |

2138 8.3.4.3 Response to an Asset Request

2139 The *Response* to an *Asset Request* **SHOULD** be an *MTCConnectAssets Response Document*
 2140 containing information for one or more *Asset Documents* designated by the *Request*. The
 2141 *Response* to an *Asset Request* **MUST** always provide the most recent information available
 2142 to an *Agent*.

2143 The *Asset Documents* provided in the *MTCConnectAssets Response Document* will be lim-

2144 ited to those specified in the combination of the `path` segment of the *Asset Request* and
 2145 the parameters provided in the `query` segment of that *Request*.

2146 If the `removed` query parameter is not provided with a value of `true`, *Asset Documents*
 2147 for *Assets* that have been marked as removed will not be provided in the response.

2148 8.3.4.4 HTTP Status Codes for a Asset Request

2149 The following *HTTP Status Codes* **MUST** be supported as possible responses to an *Asset*
 2150 *Request*:

Table 20: HTTP Status Codes for an Asset Request

| HTTP Status Code | Code Name | Description |
|------------------|-------------|---|
| 200 | OK | The <i>Request</i> was handled successfully. |
| 400 | Bad Request | <p>The <i>Request</i> could not be interpreted.</p> <p>The <i>Agent</i> MUST return a 400 <i>HTTP Status Code</i>. Also, the <i>Agent</i> MUST publish an <i>MTCConnectErrors Response Document</i> that identifies either <code>INVALID_URI</code> or <code>INVALID_REQUEST</code> as the <code>errorCode</code>.</p> <p>If the <code>query</code> parameters do not contain a valid value or include an invalid parameter, the <i>Agent</i> MUST return a 400 <i>HTTP Status Code</i>. Also, the <i>Agent</i> MUST publish an <i>MTCConnectErrors Response Document</i> that identifies <code>QUERY_ERROR</code> as the <code>errorCode</code>.</p> |
| 404 | Not Found | <p>The <i>Request</i> could not be interpreted.</p> <p>The <i>Agent</i> MUST return a 404 <i>HTTP Status Code</i>. Also, the <i>Agent</i> MUST publish an <i>MTCConnectErrors Response Document</i> that identifies <code>NO_DEVICE</code> or <code>ASSET_NOT_FOUND</code> as the <code>errorCode</code>.</p> |

| Continuation of Table 20 | | |
|--------------------------|---------------------------------|---|
| HTTP Status Code | Code Name | Description |
| 405 | Method Not Allowed | <p>A method other than GET was specified in the <i>Request</i> or the piece of equipment specified in the <i>Request</i> could not be found.</p> <p>The <i>Agent</i> MUST return a 405 <i>HTTP Status Code</i>. Also, the <i>Agent</i> MUST publish an <i>MTCConnectErrors Response Document</i> that identifies UNSUPPORTED as the <code>errorCode</code>.</p> |
| 406 | Not Acceptable | <p>The <i>HTTP Accept Header</i> in the <i>Request</i> was not one of the supported representations.</p> <p>The <i>Agent</i> MUST return a 406 <i>HTTP Status Code</i>. Also, the <i>Agent</i> MUST publish an <i>MTCConnectErrors Response Document</i> that identifies UNSUPPORTED as the <code>errorCode</code>.</p> |
| 431 | Request Header Fields Too Large | <p>The fields in the <i>HTTP Request</i> exceed the limit of the implementation of the <i>Agent</i>.</p> <p>The <i>Agent</i> MUST return a 431 <i>HTTP Status Code</i>. Also, the <i>Agent</i> MUST publish an <i>MTCConnectErrors Response Document</i> that identifies INVALID_REQUEST as the <code>errorCode</code>.</p> |
| 500 | Internal Server Error | <p>There was an unexpected error in the <i>Agent</i> while responding to a <i>Request</i>.</p> <p>The <i>Agent</i> MUST return a 500 <i>HTTP Status Code</i>. Also, the <i>Agent</i> MUST publish an <i>MTCConnectErrors Response Document</i> that identifies INTERNAL_ERROR as the <code>errorCode</code>.</p> |

2151 8.3.5 HTTP Errors

2152 When an *Agent* receives an *HTTP Request* that is incorrectly formatted or is not supported
 2153 by the *Agent*, the *Agent* **MUST** publish an *HTTP Error Message* which includes a specific

2154 status code from the tables above indicating that the *Request* could not be handled by the
2155 *Agent*.

2156 Also, if the *Agent* experiences an internal error and is unable to provide the requested
2157 *Response Document*, it **MUST** publish an *HTTP Error Message* that includes a specific
2158 status code from the table above.

2159 When an *Agent* encounters an error in interpreting or responding to an *HTTP Request*,
2160 the *Agent* **MUST** also publish an *MTConnectErrors Response Document* that provides
2161 additional details about the error. See *Section 9 - Error Information Model* for details on
2162 the *MTConnectErrors Response Document*.

2163 8.3.6 Streaming Data

2164 *HTTP Data Streaming* is a method for a server to provide a continuous stream of informa-
2165 tion in response to a single *Request* from a client software application. *Data Streaming* is
2166 a version of a *Publish/Subscribe* method of communications.

2167 When an *HTTP Request* includes an `interval <query>` parameter, an *Agent* **MUST**
2168 provide data with a minimum delay between the end of one data transmission and the
2169 beginning of the next data transmission defined by the value (in milliseconds) provided
2170 for `interval` parameter. A value of zero (0) for the `interval` parameter indicates
2171 that the *Agent* should deliver data at the highest rate possible.

2172 The format of the response **MUST** use a MIME encoded message with each section sep-
2173 arated by a MIME boundary. Each section **MUST** contain an entire *MTConnectStreams*
2174 *Response Document*.

2175 If there are no available *Data Entities* to be published after the `interval` time has
2176 elapsed, an *Agent* **MUST** wait until additional information is available to be published.
2177 If no new no new information is available to be published within the time defined by the
2178 `heartbeat` parameter, the *Agent* **MUST** then send a new section to ensure the receiver
2179 that the *Agent* is functioning correctly. In this case, the content of the *MTConnect-*
2180 *Streams* document **MUST** be empty since no data is available.

2181 For more information on MIME see IETF RFC 1521 and RFC 822.

2182 An example of the format for a *HTTP Request* that includes an `interval` parameter is:

Example 8: Example for HTTP Request with interval parameter

2183 1 `http://localhost:5000/sample?interval=1000`

2184 HTTP Response Header:

Example 9: HTTP Response header

```
2185 1 HTTP/1.1 200 OK
2186 2 Connection: close
2187 3 Date: Sat, 13 Mar 2010 08:33:37 UTC
2188 4 Status: 200 OK
2189 5 Content-Disposition: inline
2190 6 X-Runtime: 144ms
2191 7 Content-Type: multipart/x-mixed-replace;boundary=
2192 8 a8e12eced4fb871ac096a99bf9728425
2193 9 Transfer-Encoding: chunked
```

2194 Lines 1-9 in *Example 9* represent a standard header for a MIME `multipart/x-mixed-`
 2195 `replace` message. The boundary is a separator for each section of the stream. Lines 7-8
 2196 indicate this is a multipart MIME message and the boundary between sections.

2197 With streaming protocols, the `Content-length` **MUST** be omitted and `Transfer-`
 2198 `Encoding` **MUST** be set to `chunked` (line 9). See IETF RFC 7230 for a full description
 2199 of the HTTP protocol and chunked encoding.

Example 10: HTTP Response header 2

```
2200 10 --a8e12eced4fb871ac096a99bf9728425
2201 11 Content-type: text/xml
2202 12 Content-length: 887
2203 13
2204 14 <?xml version="1.0" encoding="UTF-8"?>
2205 15 <MTConnectStreams ...>...
```

2206 Each section of the document begins with a boundary preceded by two hyphens (-). The
 2207 `Content-type` and `Content-length` MIME header fields **MUST** be provided for
 2208 each section and **MUST** be followed by `<CR><LF><CR><LF>` (ASCII code for `<CR>` is
 2209 13 and `<LF>` is 10) before the XML document. The header and the `<CR><LF><CR><LF>`
 2210 **MUST NOT** be included in the computation of the content length.

2211 An *Agent* **MUST** continue to stream results until the client closes the connection. The
 2212 *Agent* **MUST NOT** stop the streaming for any other reason other than the *Agent* process
 2213 shutting down or the client application becoming unresponsive and not receiving data (as
 2214 indicated by not consuming data and the write operation blocking).

2215 **8.3.6.1 Heartbeat**

2216 When *Streaming Data* is requested from a *Sample Request*, an *Agent* **MUST** support a
 2217 *heartbeat* to indicate to a client application that the HTTP connection is still viable during

2218 times when there is no new data available to be published. The *heartbeat* is indicated by
 2219 an *Agent* by sending an *MTCConnect Response Document* with an empty *Streams* container
 2220 (See *MTCConnect Standard: Part 3.0 - Streams Information Model, Section 4.1 Streams* for
 2221 more details on the *Streams* container) to the client software application.

2222 The *heartbeat* **MUST** occur on a periodic basis given by the optional *heartbeat* query
 2223 parameter and **MUST** default to 10 seconds. An *Agent* **MUST** maintain a separate *heart-*
 2224 *beat* for each client application for which the *Agent* is responding to a *Data Streaming*
 2225 *Request*.

2226 An *Agent* **MUST** begin calculating the interval for the time-period of the *heartbeat* for
 2227 each client application immediately after a *Response Document* is published to that spe-
 2228 cific client application.

2229 The *heartbeat* remains in effect for each client software application until the *Data Stream-*
 2230 *ing Request* is terminated by either the *Agent* or the client application.

2231 8.3.7 References

2232 A *Structural Element* **MAY** include a set of *References* of the following types that **MAY**
 2233 alter the content of the *MTCConnectStreams Response Documents* published in response to
 2234 a *Current Request* or a *Sample Request* as specified:

- 2235 • A *Component Reference* (*ComponentRef*) modifies the set of resulting *Data Enti-*
 2236 *tities*, limited by a path query parameter of a *Current Request* or *Sample Request*,
 2237 to include the *Data Entities* associated with the *Structural Element* whose value for
 2238 its *id* attribute matches the value provided for the *idRef* attribute of the *Comp-*
 2239 *onentRef* element. Additionally, *Data Entities* defined for any *Lower Level Struc-*
 2240 *tural Element(s)* associated with the identified *Structural Element* **MUST** also be
 2241 returned. The result is equivalent to appending `// [@id=<"idRef">]` to the path
 2242 query parameters of the *Current Request* or *Sample Request*. See *Section 8.3.2 -*
 2243 *Current Request Implemented Using HTTP* for more details on path queries.

- 2244 • A *Data Item Reference* (*DataItemRef*) modifies the set of resulting *Data Enti-*
 2245 *tities*, limited by a path query parameter of a *Current Request* or *Sample Request*, to
 2246 include the *Data Entity* whose value for its *id* attribute matches the value provided
 2247 for the *idRef* attribute of the *DataItemRef* element. The result is equivalent
 2248 to appending `// [@id=<"idRef">]` to the path query parameters of the *Current*
 2249 *Request* or *Sample Request*. See *Section 8.3.2 - Current Request Implemented Using*
 2250 *HTTP* for more details on path queries.

2251 **9 Error Information Model**

2252 The *Error Information Model* establishes the rules and terminology that describes the *Re-*
 2253 *sponse Document* returned by an *Agent* when it encounters an error while interpreting a
 2254 *Request* for information from a client software application or when an *Agent* experiences
 2255 an error while publishing the *Response* to a *Request* for information.

2256 An *Agent* provides the information regarding errors encountered when processing a *Re-*
 2257 *quest* for information by publishing an *MTCConnectErrors Response Document* to the client
 2258 software application that made the *Request* for information.

2259 **9.1 MTCConnectError Response Document**

2260 The *MTCConnectErrors Response Document* is comprised of two sections: Header and
 2261 Errors.

2262 The Header section contains information defining the creation of the document and the
 2263 data storage capability of the *Agent* that generated the document. (See *Section 6.5.4 -*
 2264 *Header for MTCConnectError*)

2265 The Errors section of the *MTCConnectErrors Response Document* is a *Structural Element*
 2266 that organizes *Data Entities* describing each of the errors reported by an *Agent*.

2267 **9.1.1 Structural Element for MTCConnectError**

2268 *Structural Elements* are XML elements that form the logical structure for an XML docu-
 2269 ment. The *MTCConnectErrors Response Document* has only one *Structural Element*. This
 2270 *Structural Element* is Errors. Errors is an XML container element that organizes the
 2271 information and data associated with all errors relevant to a specific *Request* for informa-
 2272 tion.

2273 The following *XML Schema* represents the structure of the Errors XML element.

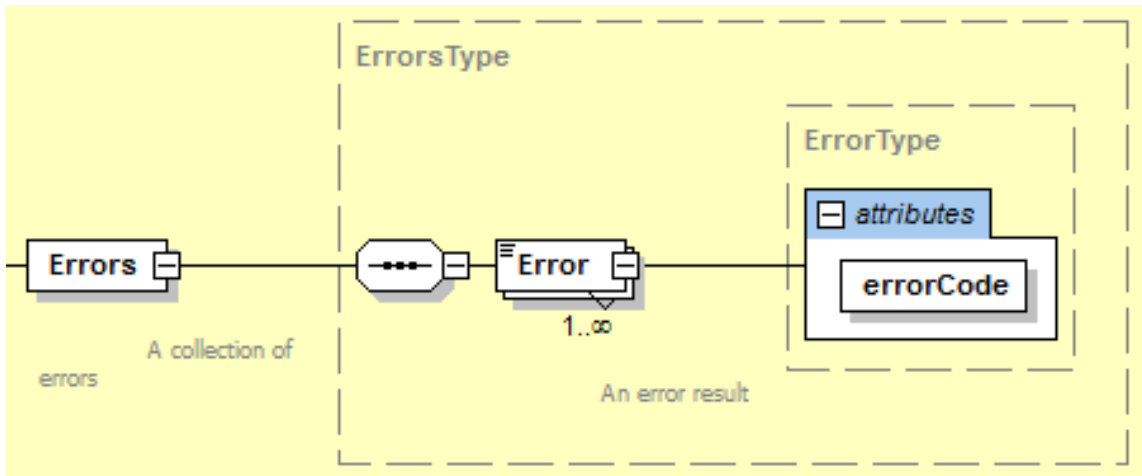

Figure 21: Errors Schema Diagram

Table 21: MTConnect Errors Element

| Element | Description | Occurrence |
|---------|---|------------|
| Errors | <p>An XML container element in an <i>MTConnectErrors Response Document</i> provided by an <i>Agent</i> when an error is encountered associated with a <i>Request</i> for information from a client software application.</p> <p>There MUST be only one <code>Errors</code> element in an <i>MTConnectErrors Response Document</i>.</p> <p>The <code>Errors</code> element MUST contain at least one <code>Error Data Entity</code> element.</p> | 1 |

2274 Note: When compatibility with Version 1.0.1 and earlier of the MTConnect Standard
 2275 is required for an implementation, the *MTConnectErrors Response Document*
 2276 contains only a single `Error Data Entity` and the *Errors Structural Element*
 2277 **MUST NOT** appear in the document.

2278 9.1.2 Error Data Entity

2279 When an *Agent* encounters an error when responding to a *Request* for information from
 2280 a client software application, the information describing the error(s) is reported as a *Data*
 2281 *Entity* in an *MTConnectErrors Response Document*. *Data Entities* are organized in the
 2282 `Errors` XML container.

2283 There is only one type of *Data Entity* defined for an *MTConnectErrors Response Docu-*
 2284 *ment*. That *Data Entity* is called `Error`.

2285 The following is an illustration of the structure of an XML document demonstrating how
 2286 `Error Data Entities` are reported in an *MTConnectErrors Response Document*:

Example 11: Example of Error in MTConnectError

```
2287 1 <MTConnectError>
2288 2   <Header/>
2289 3   <Errors>
2290 4     <Error/>
2291 5     <Error/>
2292 6     <Error/>
2293 7   </Errors>
2294 8 </MTConnectError>
```

2295 The `Errors` element **MUST** contain at least one *Data Entity*. Each *Data Entity* describes
 2296 the details for a specific error reported by an *Agent* and is represented by the XML element
 2297 named `Error`.

2298 `Error` XML elements **MAY** contain both attributes and CDATA that provide details fur-
 2299 ther defining a specific error. The CDATA **MAY** provide the complete text provided by an
 2300 *Agent* for the specific error.

2301 9.1.2.1 XML Schema Structure for Error

2302 The *XML Schema* in *Figure 22* represents the structure of an `Error` XML element show-
 2303 ing the attributes defined for `Error`.

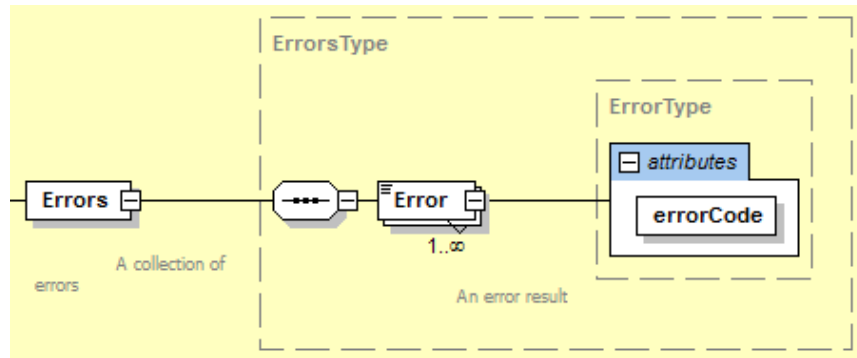

Figure 22: Error Schema Diagram

2304 **9.1.2.2 Attributes for Error**

2305 Error has one attribute. Table 22 defines this attribute that provides additional informa-
 2306 tion for an Error XML element.

Table 22: Attributes for Error

| Attribute | Description | Occurrence |
|-----------|--|------------|
| errorCode | Provides a descriptive code that indicates the type of error that was encountered by an <i>Agent</i> when attempting to respond to a <i>Request</i> for information. errorCode is a required attribute. | 1 |

2307 **9.1.2.3 Values for errorCode**

2308 There is a limited vocabulary defined for errorCode. The value returned for error-
 2309 Code **MUST** be one of the following:

Table 23: Values for errorCode

| Value for errorCode | Description |
|---------------------|---|
| ASSET_NOT_FOUND | The <i>Request</i> for information specifies an <i>MTCConnect Asset</i> that is not recognized by the <i>Agent</i> . |
| INTERNAL_ERROR | The <i>Agent</i> experienced an error while attempting to published the requested information. |
| INVALID_REQUEST | The <i>Request</i> contains information that was not recognized by the <i>Agent</i> . |
| INVALID_URI | The URI provided was incorrect. |
| INVALID_XPATH | The XPath identified in the <i>Request</i> for information could not be parsed correctly by the <i>Agent</i> . This could be caused by an invalid syntax or the XPath did not match a valid identify for any information stored in the <i>Agent</i> . |
| NO_DEVICE | The identity of the piece of equipment specified in the <i>Request</i> for information is not associated with the <i>Agent</i> . |
| OUT_OF_RANGE | The <i>Request</i> for information specifies <i>Streaming Data</i> that includes sequence number(s) for pieces of data that are beyond the end of the <i>buffer</i> . |
| QUERY_ERROR | The <i>Agent</i> was unable to interpret the <i>Query</i> . The <i>Query</i> parameters do not contain valid values or include an invalid parameter. |
| TOO_MANY | The <code>count</code> parameter provided in the <i>Request</i> for information requires either of the following: <ul style="list-style-type: none"> - <i>Streaming Data</i> that includes more pieces of data than the <i>Agent</i> is capable of organizing in an <i>MTCConnectStreams Response Document</i>. - Assets that include more <i>Asset Documents</i> in an <i>MTCConnectAssets Response Document</i> than the <i>Agent</i> is capable of handling. |
| UNAUTHORIZED | The <i>Requester</i> does not have sufficient permissions to access the requested information. |
| UNSUPPORTED | A valid <i>Request</i> was provided, but the <i>Agent</i> does not support the feature or type of <i>Request</i> . |

2310 9.1.2.4 CDATA for Error

2311 The CDATA for `Error` contains a textual description of the error and any additional
 2312 information an *Agent* is capable of providing regarding a specific error. The *Valid Data*
 2313 *Value* returned for `Error` **MAY** be any text string.

2314 9.1.3 Examples for `MTConnectError`

2315 *Example 12* is an example demonstrating the structure of an *MTConnectErrors Response*
 2316 *Document*:

Example 12: Example of structure for `MTConnectError`

```

2317 1 <?xml version="1.0" encoding="UTF-8"?>
2318 2 <MTConnectError
2319 3   xmlns="urn:mtconnect.org:MTConnectError:1.4"
2320 4   xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance
2321 5   xsi:schemaLocation="urn:mtconnect.org:MTConnectError
2322 6     :1.4/schemas/MTConnectError_1.4.xsd">
2323 7   <Header creationTime="2010-03-12T12:33:01Z"
2324 8     sender="MyAgent" version="1.4.1.10"
2325 9     bufferSize="131000" instanceId="1383839" />
2326 10 <Errors>
2327 11   <Error errorCode="OUT_OF_RANGE" >Argument was
2328 12     out of range</Error>
2329 13   <Error errorCode="INVALID_XPATH" >Bad
2330 14     path</Error>
2331 15 </Errors>
2332 16 </MTConnectError>

```

2333 *Example 13* is an example demonstrating the structure of an *MTConnectErrors Response*
 2334 *Document* when backward compatibility with Version 1.0.1 and earlier of the `MTConnect`
 2335 `Standard` is required. In this case, the *Document Body* contains only a single *Error Data*
 2336 *Entity* and the `Errors Structural Element` **MUST NOT** appear in the document.

Example 13: Example of structure for `MTConnectError` when backward compatibility is required

```

2337 1 <?xml version="1.0" encoding="UTF-8"?>
2338 2 <MTConnectError
2339 3   xmlns="urn:mtconnect.org:MTConnectError:1.1"
2340 4   xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance
2341 5   xsi:schemaLocation="urn:mtconnect.org:MTConnectError
2342 6     :1.1/schemas/MTConnectError_1.1.xsd">
2343 7   <Header creationTime="2010-03-12T12:33:01Z"
2344 8     sender="MyAgent" version="1.1.0.10"
2345 9     bufferSize="131000" instanceId="1383839" />

```

```
2346 10    <Error errorCode="OUT_OF_RANGE" >Argument was out
2347 11      of range</Error>
2348 12 </MTConnectError>
```

2391 B Fundamentals of Using XML to Encode Response Documents

2392 The MTConnect Standard specifies the structures and constructs that are used to encode
 2393 *Response Documents*. When these *Response Documents* are encoded using XML, there
 2394 are additional rules defined by the XML standard that apply for creating an XML compli-
 2395 ant document. An implementer should refer to the W3C website for additional information
 2396 on XML documentation and implementation details - <http://www.w3.org/XML>.

2397 The following provides specific terms and guidelines referenced in the MTConnect Stan-
 2398 dard for forming *Response Documents* with XML:

- 2399 • **tag**: A `tag` is an XML construct that forms the foundation for an XML expression.
 2400 It defines the scope (beginning and end) of an XML expression. The main types of
 2401 tags are:
 - 2402 • **start-tag**: Designates the beginning on an XML element; e.g., `<Element Name>`
 - 2403 • **end-tag**: Designates the end on an XML element; e.g., `</Element Name>`.
 - 2404 Note: If an element has no *Child Elements* or CDATA, the `end-tag` may be
 2405 shortened to `/>`.
 - 2406 • **Element**: An element is an XML statement that is the primary building block
 2407 for a document encoded using XML. An element begins with a `start-tag` and
 2408 ends with a matching `end-tag`. The characters between the `start-tag` and the
 2409 `end-tag` are the element's content. The content may contain attributes, CDATA,
 2410 and/or other elements. If the content contains additional elements, these elements
 2411 are called *Child Elements*.
 2412 An example would be: `<Element Name>Content of the Element</Element Name>`.
 - 2413 • **Child Element**: An XML element that is contained within a higher-level *Parent El-*
 2414 *ement*. A *Child Element* is also known as a sub-element. XML allows an unlimited
 2415 hierarchy of *Parent Element-Child Element* relationships that establishes the struc-
 2416 ture that defines how the various pieces of information in the document relate to
 2417 each other. A *Parent Element* may have multiple associated *Child Elements*.
 - 2418 • **Element Name**: A descriptive identifier contained in both the `start-tag` and
 2419 `end-tag` that provides the name of an XML element.
 - 2420 • **Attribute**: A construct consisting of a name-value pair that provides additional
 2421 information about that XML element. The format for an attribute is `name="value"`;
 2422 where the value for the attribute is enclosed in a set of quotation (") marks. An XML
 2423 attribute **MUST** only have a single value and each attribute can appear at most once
 2424 in each element. Also, each attribute **MUST** be defined in a *schema* to either be
 2425 required or optional.

- 2426 • An example of attributes for an XML element is *Example 14*:

Example 14: Example of attributes for an element

```
2427 1 <DataItem category="SAMPLE" id="S1load"
2428 2   nativeUnits="PERCENT" type="LOAD"
2429 3   units="PERCENT"/>
```

2430 In this example, `DataItem` is the `ElementName`. `category`, `id`, `nativeU-`
 2431 `units`, `type`, and `units` are the names of the attributes. "SAMPLE", "S1load",
 2432 "PERCENT", "LOAD", and "PERCENT" are the values for each of the respective
 2433 attributes.

- 2434 • **CDATA:** CDATA is an XML term representing *Character Data*. *Character Data*
 2435 contains a value(s) or text that is associated with an XML element. CDATA can be
 2436 restricted to certain formats, patterns, or words.

2437 An example of CDATA associated with an XML element would be *Example 15*:

Example 15: Example of cdata associated with element

```
2438 1 <Message id="M1">This is some text</Message>
```

2439 In this example, `Message` is the `ElementName` and `This is some text` is
 2440 the CDATA.

- 2441 • **namespace:** An XML *namespace* defines a unique vocabulary for named elements
 2442 and attributes in an XML document. An XML document may contain content that is
 2443 associated with multiple *namespaces*. Each *namespace* has its own unique identifier.

2444 Elements and attributes are associated with a specific *namespace* by placing a pre-
 2445 fix on the name of the element or attribute that associates that name to a specific
 2446 *namespace*; e.g., `x:MyTarget` associates the element name `MyTarget` with the
 2447 *namespace* designated by `x`: (the prefix).

2448 *namespaces* are used to avoid naming conflicts within an XML document. The
 2449 naming convention used for elements and attributes may be associated with either
 2450 the default *namespace* specified in the *Header* of an XML document or they may
 2451 be associated with one or more alternate *namespaces*. All elements or attributes
 2452 associated with a *namespace* that is not the default *namespace*, must include a prefix
 2453 (e.g., `x`;) as part of the name of the element or attribute to associate it with the proper
 2454 *namespace*. See *Appendix C* for details on the structure for XML *Headers*.

2455 The names of the elements and attributes declared in a *namespace* may be identified
 2456 with a different prefix than the prefix that signifies that specific *namespace*. These
 2457 prefixes are called *namespace* aliases. As an example, MTConnect Standard spe-
 2458 cific *namespaces* are designated as `m`: and the names of the elements and attributes
 2459 defined in that *namespace* have an alias prefix of `mt`: which designates these names
 2460 as MTConnect Standard specific vocabulary; e.g., `mt:MTConnectDevices`.

2461 XML documents are encoded with a hierarchy of elements. In general, XML elements
 2462 may contain *Child Elements*, CDATA, or both. However, in the MTConnect Standard,
 2463 an element **MUST NOT** contain mixed content; meaning it cannot contain both *Child*
 2464 *Elements* and CDATA.

2465 The *semantic data model* defined for each *Response Document* specifies the elements and
 2466 *Child Elements* that may appear in a document. The *semantic data model* also defines the
 2467 number of times each element and *Child Element* may appear in the document.

2468 *Example 16* demonstrates the hierarchy of XML elements and *Child Elements* used to
 2469 form an XML document:

Example 16: Example of hierarchy of XML elements

```

2470 1 <Root Level>      (Parent Element)
2471 2   <First Level>  (Child Element to Root Level and
2472 3     Parent Element to Second Level)
2473 4     <Second Level> (Child Element to First Level
2474 5       and Parent Element to Third Level)
2475 6       <Third Level name="N1"></Third Level>
2476 7         (Child Element to Second Level)
2477 8       <Third Level name="N2"></Third Level>
2478 9         (Child Element to Second Level)
2479 10      <Third Level name="N3"></Third Level>
2480 11        (Child Element to Second Level)
2481 12      </Second Level>  (end-tag for Second Level)
2482 13     </First Level>   (end-tag for First Level)
2483 14    </Root Level>    (end-tag for Root Level)
  
```

2484 In the *Example 16*, *Root Level* and *First Level* have one *Child Element* (sub-elements)
 2485 each and *Second Level* has three *Child Elements*; each called *Third Level*. Each *Third*
 2486 *Level* element has a different name attribute. Each level in the structure is an element and
 2487 each lower level element is a *Child Element*.

2488 C Schema and Namespace Declaration Information

2489 There are four pseudo-attributes typically included in the *Header* of a *Response Document*
 2490 that declare the *schema* and *namespace* for the document. Each of these pseudo-attributes
 2491 provides specific information for a client software application to properly interpret the
 2492 content of the *Response Document*.

2493 The pseudo-attributes include:

2494 • `xmlns:xsi` – The `xsi` portion of this attribute name stands for *XML Schema*
 2495 instance. An *XML Schema* instance provides information that may be used by a
 2496 software application to interpret XML specific information within a document. See
 2497 the W3C website for more details on `xmlns:xsi`.

2498 • `xmlns` – Declares the default *namespace* associated with the content of the *Re-*
 2499 *sponse Document*. The default *namespace* is considered to apply to all elements and
 2500 attributes whenever the name of the element or attribute does not contain a prefix
 2501 identifying an alternate *namespace*.

2502 The value of this attribute is an URN identifying the name of the file that defines
 2503 the details of the *namespace* content. This URN provides a unique identify for the
 2504 *namespace*.

2505 • `xmlns:m` – Declares the MTConnect specific *namespace* associated with the con-
 2506 tent of the *Response Document*. There may be multiple *namespaces* declared for
 2507 an XML document. Each may be associated to the default *namespace* or it may be
 2508 totally independent. The `:m` designates that this is a specific MTConnect *namespace*
 2509 which is directly associated with the default *namespace*.

2510 Note: See *Section 6.7 - Extensibility* for details regarding extended *namespaces*.

2511 The value associated with this attribute is an URN identifying the name of the file
 2512 that defines the details of the *namespace* content.

2513 • `xsi:schemaLocation` - Declares the name for the *schema* associated with the
 2514 *Response Document* and the location of the file that contains the details of the
 2515 *schema* for that document.

2516 The value associated with this attribute has two parts:

2517 - A URN identifying the name of the specific *XML Schema* instance associated
 2518 with the *Response Document*.

2519 - The path to the location where the file describing the specific *XML Schema*
 2520 instance is located. If the file is located in the same root directory where the *Agent*
 2521 is installed, then the local path MAY be declared. Otherwise, a fully qualified URL
 2522 must be declared to identify the location of the file.

2523 Note: In the format of the value associated with `xsi:schemaLocation`, the
 2524 URN and the path to the *schema* file **MUST** be separated by a “space”.

2525 In *Example 17*, the first line is the *XML Declaration*. The second line is a *Root Ele-*
 2526 *ment* called `MTConnectDevices`. The remaining four lines are the pseudo-attributes of
 2527 `MTConnectDevices` that declare the XML *schema* and *namespace* associated with an
 2528 *MTConnectDevices Response Document*.

Example 17: Example of schema and namespace declaration

```
2529 1 <?xml version="1.0" encoding="UTF-8"?>
2530 2 <MTConnectDevices
2531 3   xmlns:xsi=http://www.w3.org/2001/XMLSchema-instance
2532 4   xmlns="urn:mtconnect.org:MTConnectDevices:1.3"
2533 5   xmlns:m="urn:mtconnect.org:MTConnectDevices:1.3"
2534 6   xsi:schemaLocation="urn:mtconnect.org:
2535 7     MTConnectDevices:1.3 /schemas/MTConnectDevices\_1.3.xsd">
```

2536 The format for the values provided for each of the pseudo-attributes **MUST** reference
 2537 the *semantic data model* (e.g., `MTConnectDevices`, `MTConnectStreams`, `MTCon-`
 2538 `nectAssets`, or `MTConnectError`) and the version (i.e.; 1.1, 1.2, 1.3, etc.) of
 2539 the MTConnect Standard that depict the *schema* and *namespace(s)* associated with a spe-
 2540 cific *Response Document*.

2541 When an implementer chooses to extend an MTConnect *Data Model* by adding custom
 2542 data types or additional *Structural Elements*, the *schema* and *namespace* for that *Data*
 2543 *Model* should be updated to reflect the additional content. When this is done, the *names-*
 2544 *pace* and *schema* information in the *Header* should be updated to reflect the URI for the
 2545 extended *namespace* and *schema*.
