

MTConnect[®] Standard
Part 5 – Interfaces
Version 1.7.0

Prepared for: MTConnect Institute
Prepared on: February 25, 2021

MTConnect[®] is a registered trademark of AMT - The Association for Manufacturing Technology. Use of *MTConnect* is limited to use as specified on <http://www.mtconnect.org/>.

MTConnect Specification and Materials

The Association for Manufacturing Technology (AMT) owns the copyright in this *MTConnect* Specification or Material. AMT grants to you a non-exclusive, non-transferable, revocable, non-sublicensable, fully-paid-up copyright license to reproduce, copy and redistribute this *MTConnect* Specification or Material, provided that you may only copy or redistribute the *MTConnect* Specification or Material in the form in which you received it, without modifications, and with all copyright notices and other notices and disclaimers contained in the *MTConnect* Specification or Material.

If you intend to adopt or implement an *MTConnect* Specification or Material in a product, whether hardware, software or firmware, which complies with an *MTConnect* Specification, you shall agree to the *MTConnect* Specification Implementer License Agreement (“Implementer License”) or to the *MTConnect* Intellectual Property Policy and Agreement (“IP Policy”). The Implementer License and IP Policy each sets forth the license terms and other terms of use for *MTConnect* Implementers to adopt or implement the *MTConnect* Specifications, including certain license rights covering necessary patent claims for that purpose. These materials can be found at www.MTConnect.org, or by contacting <mailto:info@MTConnect.org>.

MTConnect Institute and AMT have no responsibility to identify patents, patent claims or patent applications which may relate to or be required to implement a Specification, or to determine the legal validity or scope of any such patent claims brought to their attention. Each *MTConnect* Implementer is responsible for securing its own licenses or rights to any patent or other intellectual property rights that may be necessary for such use, and neither AMT nor *MTConnect* Institute have any obligation to secure any such rights.

This Material and all *MTConnect* Specifications and Materials are provided “as is” and *MTConnect* Institute and AMT, and each of their respective members, officers, affiliates, sponsors and agents, make no representation or warranty of any kind relating to these materials or to any implementation of the *MTConnect* Specifications or Materials in any product, including, without limitation, any expressed or implied warranty of noninfringement, merchantability, or fitness for particular purpose, or of the accuracy, reliability, or completeness of information contained herein. In no event shall *MTConnect* Institute or AMT be liable to any user or implementer of *MTConnect* Specifications or Materials for the cost of procuring substitute goods or services, lost profits, loss of use, loss of data or any incidental, consequential, indirect, special or punitive damages or other direct damages, whether under contract, tort, warranty or otherwise, arising in any way out of access, use or inability to use the *MTConnect* Specification or other *MTConnect* Materials, whether or not they had advance notice of the possibility of such damage.

1 1 Purpose of This Document

2 This document, *MTConnect Standard: Part 5.0 - Interfaces* of the MTConnect® Standard,
3 defines a structured data model used to organize information required to coordinate inter-
4 operations between pieces of equipment.

5 This data model is based on an *Interaction Model* that defines the exchange of information
6 between pieces of equipment and is organized in the MTConnect Standard as the XML
7 element `Interfaces`.

8 *Interfaces* is modeled as an extension to the `MTConnectDevices` and `MTConnect-`
9 `Streams` XML documents. `Interfaces` leverages similar rules and terminology as
10 those used to describe a component in the `MTConnectDevices` XML document. In-
11 `terfaces` also uses similar methods for reporting data to those used in the `MTCon-`
12 `nectStreams` XML document.

13 As defined in *MTConnect Standard: Part 2.0 - Devices Information Model*, `Interfaces`
14 is modeled as a *Top Level* component in the `MTConnectDevices` document (see *Fig-*
15 *ure 3*). Each individual `Interface` XML element is modeled as a *Lower Level* com-
16 ponent of `Interfaces`. The data associated with each *Interface* is modeled within each
17 *Lower Level* component.

18 Note: See *MTConnect Standard: Part 2.0 - Devices Information Model* and *MT-*
19 *Connect Standard: Part 3.0 - Streams Information Model* of the MTConnect
20 Standard for information on how *Interfaces* is structured in the XML docu-
21 ments which are returned from an *Agent* in response to a `probe`, `sample`, or
22 `current` request.

23 2 Terminology and Conventions

24 Refer to Section 2 of *MTConnect Standard Part 1.0 - Overview and Fundamentals* for a
 25 dictionary of terms, reserved language, and document conventions used in the MTConnect
 26 Standard.

27 2.1 Glossary

28 CDATA

29 General meaning:

30 An abbreviation for Character Data.

31 CDATA is used to describe a value (text or data) published as part of an XML ele-
 32 ment.

33 For example, "This is some text " is the CDATA in the XML element:

34 `<Message ...>This is some text</Message>`

35 Appears in the documents in the following form: CDATA

36 XML

37 Stands for eXtensible Markup Language.

38 XML defines a set of rules for encoding documents that both a human-readable and
 39 machine-readable.

40 XML is the language used for all code examples in the MTConnect Standard.

41 Refer to <http://www.w3.org/XML> for more information about XML.

42 *Agent*

43 Refers to an MTConnect Agent.

44 Software that collects data published from one or more piece(s) of equipment, orga-
 45 nizes that data in a structured manner, and responds to requests for data from client
 46 software systems by providing a structured response in the form of a *Response Doc-*
 47 *ument* that is constructed using the *semantic data models* defined in the Standard.

48 Appears in the documents in the following form: *Agent*.

49 *Child Element*

50 A portion of a data modeling structure that illustrates the relationship between an
 51 element and the higher-level *Parent Element* within which it is contained.

52 Appears in the documents in the following form: *Child Element*.

53 **Component**54 General meaning:55 A *Structural Element* that represents a physical or logical part or subpart of a piece
56 of equipment.57 Appears in the documents in the following form: *Component*.58 Used in Information Models:59 A data modeling element used to organize the data being retrieved from a piece of
60 equipment.61 ● When used as an XML container to organize *Lower Level Component* ele-
62 ments.63 Appears in the documents in the following form: *Component s*.64 ● When used as an abstract XML element. *Component* is replaced in a data
65 model by a type of *Component* element. *Component* is also an XML con-
66 tainer used to organize *Lower Level Component* elements, *Data Entities*, or
67 both.68 Appears in the documents in the following form: *Component*.69 **Controlled Vocabulary**70 A restricted set of values that may be published as the *Valid Data Value* for a *Data*
71 *Entity*.72 Appears in the documents in the following form: *Controlled Vocabulary*.73 **Current Request**74 A *Current Request* is a *Request* to an *Agent* to produce an *MTCConnectStreams Re-*
75 *sponse Document* containing the *Observations Information Model* for a snapshot of
76 the latest *observations* at the moment of the *Request* or at a given *sequence number*.77 **Data Entity**78 A primary data modeling element that represents all elements that either describe
79 data items that may be reported by an *Agent* or the data items that contain the actual
80 data published by an *Agent*.81 Appears in the documents in the following form: *Data Entity*.82 **Devices Information Model**83 A set of rules and terms that describes the physical and logical configuration for a
84 piece of equipment and the data that may be reported by that equipment.85 Appears in the documents in the following form: *Devices Information Model*.

86 ***Element Name***

87 A descriptive identifier contained in both the `start-tag` and `end-tag` of an
88 XML element that provides the name of the element.

89 Appears in the documents in the following form: *element name*.

90 Used to describe the name for a specific XML element:

91 Reference to the name provided in the `start-tag`, `end-tag`, or `empty-element`
92 `tag` for an XML element.

93 Appears in the documents in the following form: *Element Name*.

94 ***Equipment Metadata***

95 See *Metadata*

96 ***Information Model***

97 The rules, relationships, and terminology that are used to define how information is
98 structured.

99 For example, an information model is used to define the structure for each *MTCon-*
100 *nect Response Document*; the definition of each piece of information within those
101 documents and the relationship between pieces of information.

102 Appears in the documents in the following form: *Information Model*.

103 ***Interaction Model***

104 Defines how information is exchanged across an *Interface* between independent sys-
105 tems.

106 ***Interface***

107 The means by which communication is achieved between independent systems.

108 ***Lower Level***

109 A nested element that is below a higher level element.

110 ***Metadata***

111 Data that provides information about other data.

112 For example, *Equipment Metadata* defines both the *Structural Elements* that rep-
113 resent the physical and logical parts and sub-parts of each piece of equipment, the
114 relationships between those parts and sub-parts, and the definitions of the *Data En-*
115 *tities* associated with that piece of equipment.

116 Appears in the documents in the following form: *Metadata* or *Equipment Metadata*.

117 ***MTConnect Agent***

118 See definition for *Agent*.

119 ***MTConnectDevices Response Document***

120 A *Response Document* published by an *MTConnect Agent* in response to a *Probe*
121 *Request*.

122 ***MTConnectStreams Response Document***

123 A *Response Document* published by an *MTConnect Agent* in response to a *Current*
124 *Request* or a *Sample Request*.

125 ***observation***

126 The observed value of a property at a point in time.

127 ***Observations Information Model***

128 An *Information Model* that describes the *Streaming Data* reported by a piece of
129 equipment.

130 ***Parent Element***

131 An XML element used to organize *Lower Level* child elements that share a common
132 relationship to the *Parent Element*.

133 Appears in the documents in the following form: *Parent Element*.

134 ***Probe Request***

135 A *Probe Request* is a *Request* to an *Agent* to produce an *MTConnectDevices Re-*
136 *sponse Document* containing the *Devices Information Model*.

137 ***Publish/Subscribe***

138 In the *MTConnect Standard*, a communications messaging pattern that may be used
139 to publish *Streaming Data* from an *Agent*. When a *Publish/Subscribe* communi-
140 cation method is established between a client software application and an *Agent*,
141 the *Agent* will repeatedly publish a specific *MTConnectStreams* document at a
142 defined period.

143 Appears in the documents in the following form: *Publish/Subscribe*.

144 ***Request***

145 A communications method where a client software application transmits a message
146 to an *Agent*. That message instructs the *Agent* to respond with specific information.

147 Appears in the documents in the following form: *Request*.

148 ***Requester***

149 An entity that initiates a *Request* for information in a communications exchange.

150 Appears in the documents in the following form: *Requester*.

151 ***Responder***

152 An entity that responds to a *Request* for information in a communications exchange.

153 Appears in the documents in the following form: *Responder*.

154 ***Response Document***

155 An electronic document published by an *MTCConnect Agent* in response to a *Probe*
156 *Request*, *Current Request*, *Sample Request* or *Asset Request*.

157 ***Sample Request***

158 A *Sample Request* is a *Request* to an *Agent* to produce an *MTCConnectStreams Re-*
159 *sponse Document* containing the *Observations Information Model* for a set of time-
160 stamped *observations* made by *Components*.

161 ***semantic data model***

162 A methodology for defining the structure and meaning for data in a specific logical
163 way.

164 It provides the rules for encoding electronic information such that it can be inter-
165 preted by a software system.

166 Appears in the documents in the following form: *semantic data model*.

167 ***sequence number***

168 The primary key identifier used to manage and locate a specific piece of *Streaming*
169 *Data* in an *Agent*.

170 *sequence number* is a monotonically increasing number within an instance of an
171 *Agent*.

172 Appears in the documents in the following form: *sequence number*.

173 ***Streaming Data***

174 The values published by a piece of equipment for the *Data Entities* defined by the
175 *Equipment Metadata*.

176 Appears in the documents in the following form: *Streaming Data*.

177 ***Structural Element***

178 General meaning:

179 An XML element that organizes information that represents the physical and logical
180 parts and sub-parts of a piece of equipment.

181 Appears in the documents in the following form: *Structural Element*.

182 Used to indicate hierarchy of Components:

183 When used to describe a primary physical or logical construct within a piece of
184 equipment.

185 Appears in the documents in the following form: *Top Level Structural Element*.

186 When used to indicate a *Child Element* which provides additional detail describing
187 the physical or logical structure of a *Top Level Structural Element*.

188 Appears in the documents in the following form: *Lower Level Structural Element*.

189 **Top Level**

190 *Structural Elements* that represent the most significant physical or logical functions
191 of a piece of equipment.

192 **Valid Data Value**

193 One or more acceptable values or constrained values that can be reported for a *Data*
194 *Entity*.

195 Appears in the documents in the following form: *Valid Data Value(s)*.

196 **2.2 Acronyms**

207 3 Interfaces Overview

208 In many manufacturing processes, multiple pieces of equipment must work together to
209 perform a task. The traditional method for coordinating the activities between individual
210 pieces of equipment is to connect them using a series of wires to communicate equipment
211 states and demands for action. These interactions use simple binary ON/OFF signals to
212 accomplish their intention.

213 In the MTCConnect Standard, *Interfaces* provides a means to replace this traditional method
214 for interconnecting pieces of equipment with a structured *Interaction Model* that provides
215 a rich set of information used to coordinate the actions between pieces of equipment. Im-
216 plementers may utilize the information provided by this data model to (1) realize the inter-
217 action between pieces of equipment and (2) to extend the functionality of the equipment
218 to improve the overall performance of the manufacturing process.

219 The *Interaction Model* used to implement *Interfaces* provides a lightweight and efficient
220 protocol, simplifies failure recovery scenarios, and defines a structure for implementing a
221 Plug-And-Play relationship between pieces of equipment. By standardizing the informa-
222 tion exchange using this higher-level semantic information model, an implementer may
223 more readily replace a piece of equipment in a manufacturing system with any other piece
224 of equipment capable of providing similar *Interaction Model* functions.

225 Two primary functions are required to implement the *Interaction Model* for an *Interfaces*
226 and manage the flow of information between pieces of equipment. Each piece of equip-
227 ment needs to have the following:

- 228 • An *Agent* which provides:
 - 229 - The data required to implement the *Interaction Model*.
 - 230 - Any other data from a piece of equipment needed to implement the *Interface*
 - 231 – operating states of the equipment, position information, execution modes, process
 - 232 information, etc.
- 233 • A client software application that enables the piece of equipment to acquire and
- 234 interpret information from another piece of equipment.

235 3.1 Interfaces Architecture

236 MTCConnect Standard is based on a communications method that provides no direct way
237 for one piece of equipment to change the state of or cause an action to occur in another

238 piece of equipment. The *Interaction Model* used to implement *Interfaces* is based on a
 239 *Publish/Subscribe* type of communications as described in *MTCConnect Standard Part 1.0*
 240 *- Overview and Fundamentals* and utilizes a *Request* and *Response* information exchange
 241 mechanism. For *Interfaces*, pieces of equipment must perform both the publish (*Agent*)
 242 and subscribe (client) functions.

243 Note: The current definition of *Interfaces* addresses the interaction between two
 244 pieces of equipment. Future releases of the MTCConnect Standard may address
 245 the interaction between multiple (more than two) pieces of equipment.

246 *Figure 1* provides a high-level overview of a typical system architecture used to implement
 247 *Interfaces*.

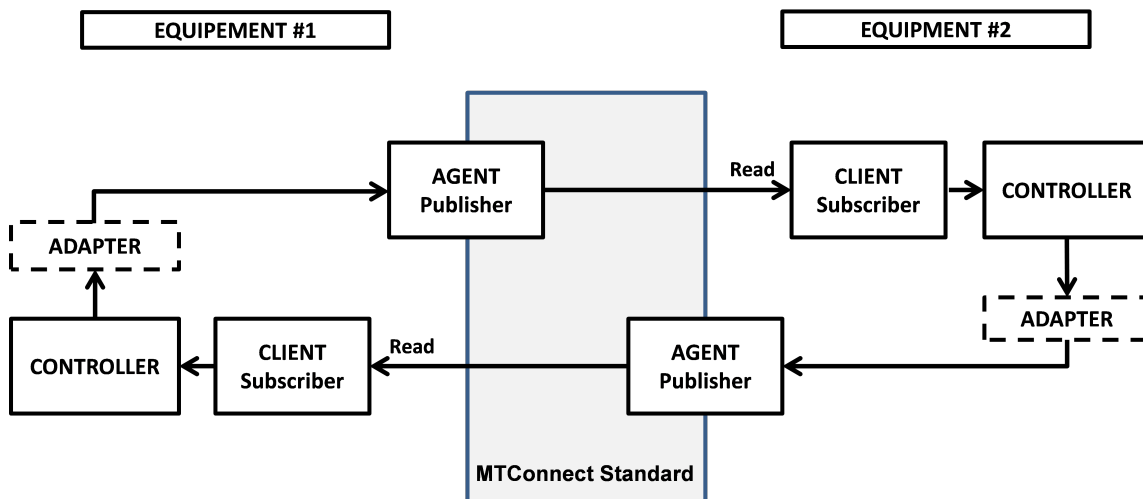

Figure 1: Data Flow Architecture for Interfaces

248 Note: The data flow architecture illustrated in *Figure 1* was historically referred to
 249 in the MTCConnect Standard as a read-read concept.

250 In the implementation of the *Interaction Model* for *Interfaces*, two pieces of equipment
 251 can exchange information in the following manner. One piece of equipment indicates a
 252 *Request* for service by publishing a type of *Request* using a data item provided through an
 253 *Agent* as defined in *Section 4 - Interfaces for Devices and Streams Information Models*.
 254 The client associated with the second piece of equipment, which is subscribing to data
 255 from the first machine, detects and interprets that *Request*. If the second machine chooses
 256 to take any action to fulfill this *Request*, it can indicate its acceptance by publishing a
 257 *Response* using a data item provided through its *Agent*. The client on the first piece of
 258 equipment continues to monitor information from the second piece of equipment until it
 259 detects an indication that the *Response* to the *Request* has been completed or has failed.

260 An example of this type of interaction between pieces of equipment can be represented

261 by a machine tool that wants the material to be loaded by a robot. In this example, the
262 machine tool is the *Requester*, and the robot is the *Responder*. On the other hand, if the
263 robot wants the machine tool to open a door, the robot becomes the *Requester* and the
264 machine tool the *Responder*.

265 3.2 Request and Response Information Exchange

266 The concept of a *Request* and *Response* information exchange is not unique to MTConnect
267 *Interfaces*. This style of communication is used in many different types of environments
268 and technologies.

269 An early version of a *Request* and *Response* information exchange was used by early
270 sailors. When it was necessary to communicate between two ships before radio com-
271 munications were available, or when secrecy was required, a sailor on each ship could
272 communicate with the other using flags as a signaling device to request information or ac-
273 tions. The responding ship could acknowledge those requests for action and identify when
274 the requested actions were completed.

275 The same basic *Request* and *Response* concept is implemented by MTConnect *Interfaces*
276 using the `EVENT` data items defined in *Section 4 - Interfaces for Devices and Streams*
277 *Information Models*.

278 The `DataItem` elements defined by the *Interaction Model* each have a *Request* and *Re-*
279 *sponse* subtype. These subtypes identify if the data item represents a *Request* or a *Re-*
280 *sponse*. Using these data items, a piece of equipment changes the state of its *Request* or
281 *Response* to indicate information that can be read by the other piece of equipment. To
282 aid in understanding how the *Interaction Model* functions, one can view this *Interaction*
283 *Model* as a simple state machine.

284 The interaction between two pieces of equipment can be described as follows. When the
285 *Requester* wants an activity to be performed, it transitions its *Request* state from a `READY`
286 state to an `ACTIVE` state. In turn, when the client on the *Responder* reads this information
287 and interprets the *Request*, the *Responder* announces that it is performing the requested
288 task by changing its response state to `ACTIVE`. When the action is finished, the *Responder*
289 changes its response state to `COMPLETE`. This pattern of *Request* and *Response* provides
290 the basis for the coordination of actions between pieces of equipment. These actions are
291 implemented using `EVENT` category data items. (See *Section 4 - Interfaces for Devices*
292 *and Streams Information Models* for details on the `Event` type data items defined for
293 *Interfaces*.)

294 Note: The implementation details of how the *Responder* piece of equipment reacts to
295 the *Request* and then completes the requested task are up to the implementer.

296 *Figure 2* provides an example of the *Request* and *Response* state machine:

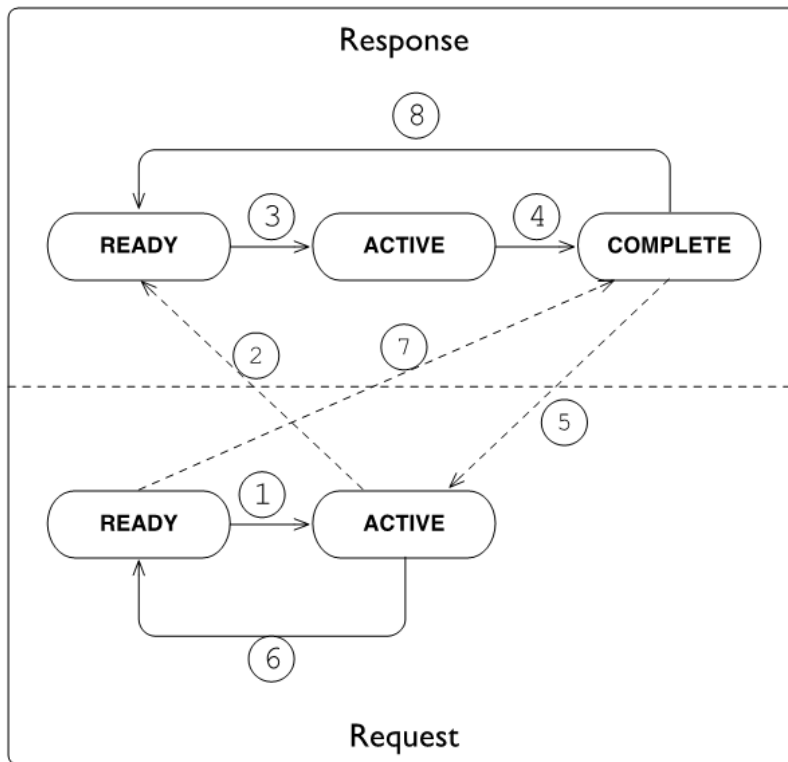

Figure 2: Request and Response Overview

297 The initial condition of both the *Request* and *Response* states on both pieces of equipment
 298 is **READY**. The dotted lines indicate the on-going communications that occur to monitor
 299 the progress of the interactions between the pieces of equipment.

300 The interaction between the pieces of equipment as illustrated in *Figure 2* progresses
 301 through the sequence in *Table 1*.

Table 1: Sequence of interaction between pieces of equipment

Step	Description
1	The <i>Request</i> transitions from READY to ACTIVE signaling that a service is needed.
2	The <i>Response</i> detects the transition of the <i>Request</i> .
3	The <i>Response</i> transitions from READY to ACTIVE indicating that it is performing the action.
4	Once the action has been performed, the <i>Response</i> transitions to COMPLETE .

Continuation of Table 1	
Step	Description
5	The <i>Request</i> detects the action is COMPLETE.
6	The <i>Request</i> transitions back to READY acknowledging that the service has been performed.
7	The <i>Response</i> detects the <i>Request</i> has returned to READY.
8	In recognition of this acknowledgement, the <i>Response</i> transitions back to READY.

302 After the final action has been completed, both pieces of equipment are back in the READY
303 state indicating that they are able to perform another action.

304 4 Interfaces for Devices and Streams Information Models

305 The *Interaction Model* for implementing *Interfaces* is defined in the MTConnect Standard
 306 as an extension to the MTConnectDevices and MTConnectStreams XML docu-
 307 ments.

308 A piece of equipment **MAY** support multiple different *Interfaces*. Each piece of equipment
 309 supporting *Interfaces* **MUST** organize the information associated with each *Interface* in a
 310 *Top Level* component called *Interfaces*. Each individual *Interface* is modeled as a *Lower*
 311 *Level* component called *Interface*. *Interface* is an abstract type XML element and
 312 will be replaced in the XML documents by specific *Interface* types defined below. The
 313 data associated with each *Interface* is modeled as data items within each of these *Lower*
 314 *Level* *Interface* components.

315 The XML tree in *Figure 3* illustrates where *Interfaces* is modeled in the *Devices Informa-*
 316 *tion Model* for a piece of equipment.

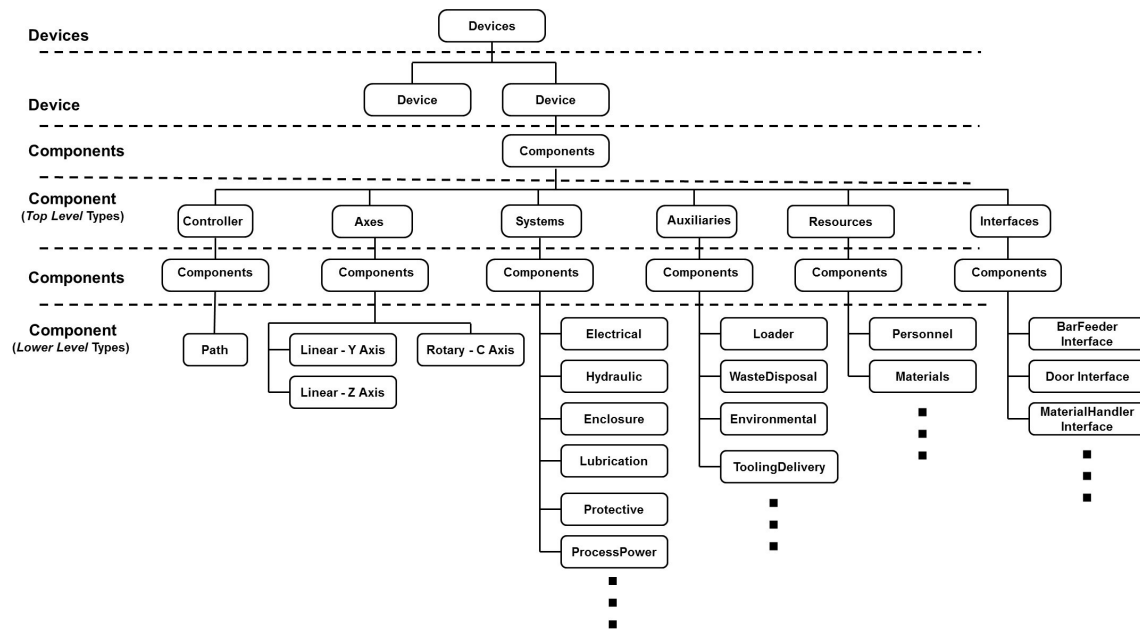

Figure 3: Interfaces as a Structural Element

317 4.1 Interfaces

318 *Interfaces* is an XML *Structural Element* in the `MTConnectDevices` XML document.
319 *Interfaces* is a container type XML element. *Interfaces* is used to group information de-
320 scribing *Lower Level Interface* XML elements, which each provide information for
321 an individual *Interface*.

322 If the *Interfaces* container appears in the XML document, it **MUST** contain one or more
323 *Interface* type XML elements.

324 4.2 Interface

325 *Interface* is the next level of *Structural Element* in the `MTConnectDevices` XML
326 document. As an abstract type XML element, *Interface* will be replaced in the XML
327 documents by specific *Interface* types defined below.

328 Each *Interface* is also a container type element. As a container, the *Interface*
329 XML element is used to organize information required to implement the *Interaction Model*
330 for an *Interface*. It also provides structure for describing the *Lower Level Structural Ele-*
331 *ments* associated with the *Interface*. Each *Interface* contains *Data Entities* avail-
332 able from the piece of equipment that may be needed to coordinate activities with associ-
333 ated pieces of equipment.

334 The information provided by a piece of equipment for each *Interface* is returned in a `Com-`
335 `ponentStream` container of an `MTConnectStreams` document in the same manner
336 as all other types of components.

337 4.2.1 XML Schema Structure for Interface

338 The XML schema in *Figure 4* represents the structure of an *Interface* XML element.

339 The schema for an *Interface* element is the same as defined for *Component* elements
340 described in Section 4.4 in *MTConnect Standard: Part 2.0 - Devices Information Model*
341 of the *MTConnect Standard*. The *Figure 4* shows the attributes defined for *Interface*
342 and the elements that may be associated with *Interface*.

Figure 4: Interface Schema

343 Refer to *MTCConnect Standard: Part 2.0 - Devices Information Model*, Section 4.4 for
 344 complete descriptions of the attributes and elements that are illustrated in the *Figure 4* for
 345 *Interface*.

346 4.2.2 Interface Types

347 As an abstract type XML element, *Interface* is replaced in the *MTCConnectDevices*
 348 document with a XML element representing a specific type of *Interface*. An initial list of
 349 *Interface* types is defined in the *Table 2*.

Table 2: Interface types

Interface	Description
BarFeederInterface	<p>BarFeederInterface provides the set of information used to coordinate the operations between a Bar Feeder and another piece of equipment.</p> <p>Bar Feeder is a piece of equipment that pushes bar stock (i.e., long pieces of material of various shapes) into an associated piece of equipment – most typically a lathe or turning center.</p>

Continuation of Table 2	
Interface	Description
MaterialHandlerInterface	<p>MaterialHandlerInterface provides the set of information used to coordinate the operations between a piece of equipment and another associated piece of equipment used to automatically handle various types of materials or services associated with the original piece of equipment.</p> <p>A material handler is a piece of equipment capable of providing any one, or more, of a variety of support services for another piece of equipment or a process:</p> <ul style="list-style-type: none"> Loading/unloading material or tooling Part inspection Testing Cleaning Etc. <p>A robot is a common example of a material handler.</p>
DoorInterface	<p>DoorInterface provides the set of information used to coordinate the operations between two pieces of equipment, one of which controls the operation of a door.</p> <p>The piece of equipment that is controlling the door MUST provide the data item DOOR_STATE as part of the set of information provided.</p>

Continuation of Table 2	
Interface	Description
ChuckInterface	<p>ChuckInterface provides the set of information used to coordinate the operations between two pieces of equipment, one of which controls the operation of a chuck.</p> <p>The piece of equipment that is controlling the chuck MUST provide the data item CHUCK_STATE as part of the set of information provided.</p>

350 Note: Additional `Interface` types may be defined in future releases of the MT-
351 Connect Standard.

352 In order to implement the *Interaction Model* for *Interfaces*, each piece of equipment as-
353 sociated with an *Interface* **MUST** provide an `Interface` XML element for that type of
354 *Interface*. A piece of equipment **MAY** support any number of unique *Interfaces*.

355 4.2.3 Data for Interface

356 Each *Interface* **MUST** provide (1) the data associated with the specific *Interface* to im-
357 plement the *Interaction Model* and (2) any additional data that may be needed by another
358 piece of equipment to understand the operating states and conditions of the first piece of
359 equipment as it applies to the *Interface*.

360 Details on data items specific to the *Interaction Model* for each type of *Interface* are pro-
361 vided in *Section 4.2.4 - Data Items for Interface*.

362 An implementer may choose any other data available from a piece of equipment to describe
363 the operating states and other information needed to support an *Interface*.

364 4.2.3.1 References for Interface

365 Some of the data items needed to support a specific *Interface* may already be defined else-
366 where in the XML document for a piece of equipment. However, the implementer may
367 not be able to directly associate this data with the *Interface* since the MTConnect Standard
368 does not permit multiple occurrences of a piece of data to be configured in a XML docu-
369 ment. `References` provides a mechanism for associating information defined elsewhere

370 in the *Information Model* for a piece of equipment with a specific *Interface*.

371 *References* is an XML container that organizes pointers to information defined else-
372 where in the XML document for a piece of equipment. *References* **MAY** contain one
373 or more *Reference* XML elements.

374 *Reference* is an XML element that provides an individual pointer to information that is
375 associated with another *Structural Element* or *Data Entity* defined elsewhere in the XML
376 document that is also required for an *Interface*.

377 *References* is an economical syntax for providing interface specific information with-
378 out directly duplicating the occurrence of the data. It provides a mechanism to include all
379 necessary information required for interaction and deterministic information flow between
380 pieces of equipment.

381 For more information on the definition for *References* and *Reference*, see Section
382 4.7 and 4.8 of *MTConnect Standard: Part 2.0 - Devices Information Model*.

383 4.2.4 Data Items for Interface

384 Each *Interface* XML element contains data items which are used to communicate
385 information required to execute the *Interface*. When these data items are read by another
386 piece of equipment, that piece of equipment can then determine the actions that it may
387 take based upon that data.

388 Some data items **MAY** be directly associated with the *Interface* element and others
389 will be organized in a *Lower Level References* XML element.

390 It is up to an implementer to determine which additional data items are required for a
391 particular *Interface*.

392 The data items that have been specifically defined to support the implementation of an
393 *Interface* are provided below.

394 4.2.4.1 INTERFACE_STATE for Interface

395 *INTERFACE_STATE* is a data item specifically defined for *Interfaces*. It defines the
396 operational state of the *Interface*. This is an indicator identifying whether the *Interface* is
397 functioning or not.

398 An *INTERFACE_STATE* data item **MUST** be defined for every *Interface* XML ele-

399 ment.

400 INTERFACE_STATE is reported in the MTConnectStreams XML document as In-
401 terfaceState. InterfaceState reports one of two states – ENABLED or DIS-
402 ABLED, which are provided in the CDATA for InterfaceState.

403 The *Table 3* shows both the INTERFACE_STATE data item as defined in the MTCon-
404 nectDevices document and the corresponding *Element Name* that **MUST** be reported
405 in the MTConnectStreams document.

Table 3: InterfaceState Event

DataItem Type	Element Name	Description
INTERFACE_STATE	InterfaceState	<p>The current functional or operational state of an Interface type element indicating whether the <i>Interface</i> is active or not currently functioning.</p> <p><i>Valid Data Values:</i></p> <p>ENABLED: The <i>Interface</i> is currently operational and performing as expected.</p> <p>DISABLED: The <i>Interface</i> is currently not operational.</p> <p>When the INTERFACE_STATE is DISABLED, the state of all data items that are specific for the <i>Interaction Model</i> associated with that <i>Interface</i> MUST be set to NOT_READY.</p>

406 4.2.4.2 Specific Data Items for the Interaction Model for Interface

407 A special set of data items have been defined to be used in conjunction with Interface
408 type elements. When modeled in the MTConnectDevices document, these data items
409 are all *Data Entities* in the EVENT category (See *MTConnect Standard: Part 3.0 - Streams*
410 *Information Model* for details on how the corresponding data items are reported in the
411 MTConnectStreams document). They provide information from a piece of equipment
412 to *Request* a service to be performed by another associated piece of equipment; and for

413 the associated piece of equipment to indicate its progress in performing its *Response* to the
414 *Request* for service.

415 Many of the data items describing the services associated with an *Interface* are paired to
416 describe two distinct actions – one to *Request* an action to be performed and a second to
417 reverse the action or to return to an original state. For example, a `DoorInterface` will
418 have two actions `OPEN_DOOR` and `CLOSE_DOOR`. An example of an implementation of
419 this would be a robot that indicates to a machine that it would like to have a door opened
420 so that the robot could extract a part from the machine and then asks the machine to close
421 that door once the part has been removed.

422 When these data items are used to describe a service associated with an *Interface*, they
423 **MUST** have one of the following two subType elements: `REQUEST` or `RESPONSE`. These
424 subType elements **MUST** be specified to define whether the piece of equipment is func-
425 tioning as the *Requester* or *Responder* for the service to be performed. The *Requester*
426 **MUST** specify the `REQUEST` subType for the data item and the *Responder* **MUST** specify
427 a corresponding `RESPONSE` subType for the data item to enable the coordination between
428 the two pieces of equipment.

429 These data items and their associated subType provide the basic structure for implementing
430 the *Interaction Model* for an *Interface*.

431 *Table 4* provides a list of the data items that have been defined to identify the services to
432 be performed for or by a piece of equipment associated with an *Interface*.

433 The *Table 4* also provides the corresponding transformed *Element Name* for each data item
434 that **MAY** be returned by an *Agent* as an `Event` type XML *Data Entity* in the `MTCOn-`
435 `nectStreams` XML document. The *Controlled Vocabulary* for each of these data items
436 are defined in *Section 4.2.4.3 - Event States for Interfaces*.

Table 4: Event Data Item types for Interface

DataItem Type	Element Name	Description
MATERIAL_FEED	MaterialFeed	Service to advance material or feed product to a piece of equipment from a continuous or bulk source.
MATERIAL_CHANGE	MaterialChange	Service to change the type of material or product being loaded or fed to a piece of equipment.
MATERIAL_-RETRACT	MaterialRetract	Service to remove or retract material or product.

Continuation of Table 4		
DataItem Type	Element Name	Description
PART_CHANGE	PartChange	Service to change the part or product associated with a piece of equipment to a different part or product.
MATERIAL_LOAD	MaterialLoad	Service to load a piece of material or product.
MATERIAL_UNLOAD	MaterialUnload	Service to unload a piece of material or product.
OPEN_DOOR	OpenDoor	Service to open a door.
CLOSE_DOOR	CloseDoor	Service to close a door.
OPEN_CHUCK	OpenChuck	Service to open a chuck.
CLOSE_CHUCK	CloseChuck	Service to close a chuck.

437 4.2.4.3 Event States for Interfaces

438 For each of the data items above, the *Valid Data Values* for the CDATA that is returned
 439 for these data items in the MTConnectStreams document is defined by a *Controlled*
 440 *Vocabulary*. This *Controlled Vocabulary* represents the state information to be communi-
 441 cated by a piece of equipment for the data items defined in the *Table 4*.

442 The *Request* portion of the *Interaction Model* for *Interfaces* has four states as defined in
 443 the *Table 5*.

Table 5: Request States

Request State	Description
NOT_READY	The <i>Requester</i> is not ready to make a <i>Request</i> .
READY	The <i>Requester</i> is prepared to make a <i>Request</i> , but no <i>Request</i> for service is required. The <i>Requester</i> will transition to ACTIVE when it needs a service to be performed.
ACTIVE	The <i>Requester</i> has initiated a <i>Request</i> for a service and the service has not yet been completed by the <i>Responder</i> .

Continuation of Table 5	
Request State	Description
FAIL	<p>CONDITION 1:</p> <p>When the <i>Requester</i> has detected a failure condition, it indicates to the <i>Responder</i> to either not initiate an action or stop its action before it completes by changing its state to FAIL.</p> <p>CONDITION 2:</p> <p>If the <i>Responder</i> changes its state to FAIL, the <i>Requester</i> MUST change its state to FAIL.</p> <p>ACTIONS:</p> <p>After detecting a failure, the <i>Requester</i> SHOULD NOT change its state to any other value until the <i>Responder</i> has acknowledged the FAIL state by changing its state to FAIL.</p> <p>Once the FAIL state has been acknowledged by the <i>Responder</i>, the <i>Requester</i> may attempt to clear its FAIL state.</p> <p>As part of the attempt to clear the FAIL state, the <i>Requester</i> MUST reset any partial actions that were initiated and attempt to return to a condition where it is again ready to perform a service. If the recovery is successful, the <i>Requester</i> changes its <i>Request</i> state from FAIL to READY. If for some reason the <i>Requester</i> is not again prepared to perform a service, it transitions its state from FAIL to NOT_READY.</p>

444 *Figure 5* shows a graphical representation of the possible state transitions for a *Request*.

Figure 5: Request State Diagram

445 The *Response* portion of the *Interaction Model* for *Interfaces* has five states as defined in
 446 the *Table 6*.

Table 6: Response States

Response State	Description
NOT_READY	The <i>Responder</i> is not ready to perform a service.
READY	<p>The <i>Responder</i> is prepared to react to a Request, but no Request for service has been detected.</p> <p>The <i>Responder</i> MUST transition to ACTIVE to inform the <i>Requester</i> that it has detected and accepted the Request and is in the process of performing the requested service.</p> <p>If the <i>Responder</i> is not ready to perform a Request, it MUST transition to a NOT_READY state.</p>
ACTIVE	<p>The <i>Responder</i> has detected and accepted a Request for a service and is in the process of performing the service, but the service has not yet been completed.</p> <p>In normal operation, the <i>Responder</i> MUST NOT change its state to ACTIVE unless the <i>Requester</i> state is ACTIVE.</p>

Continuation of Table 6	
Response State	Description
FAIL	<p>CONDITION 1:</p> <p>The <i>Responder</i> has failed while executing the actions required to perform a service and the service has not yet been completed or the <i>Responder</i> has detected that the <i>Requester</i> has unexpectedly changed state.</p> <p>CONDITION 2:</p> <p>If the <i>Requester</i> changes its state to FAIL, the <i>Responder</i> MUST change its state to FAIL.</p> <p>ACTIONS:</p> <p>After entering a FAIL state, the <i>Responder</i> SHOULD NOT change its state to any other value until the <i>Requester</i> has acknowledged the FAIL state by changing its state to FAIL.</p> <p>Once the FAIL state has been acknowledged by the <i>Requester</i>, the <i>Responder</i> may attempt to clear its FAIL state.</p> <p>As part of the attempt to clear the FAIL state, the <i>Responder</i> MUST reset any partial actions that were initiated and attempt to return to a condition where it is again ready to perform a service. If the recovery is successful, the <i>Responder</i> changes its <i>Response</i> state from FAIL to READY. If for some reason the <i>Responder</i> is not again prepared to perform a service, it transitions its state from FAIL to NOT_READY.</p>
COMPLETE	<p>The <i>Responder</i> has completed the actions required to perform the service.</p> <p>The <i>Responder</i> MUST remain in the COMPLETE state until the <i>Requester</i> acknowledges that the service is complete by changing its state to READY.</p> <p>At that point, the <i>Responder</i> MUST change its state to either READY if it is again prepared to perform a service or NOT_READY if it is not prepared to perform a service.</p>

447 The state values described in the *Table 6* and *Table 6* **MUST** be provided in the CDATA for
 448 each of the *Interface* specific data items provided in the `MTConnectStreams` document.

449 *Figure 6* shows a graphical representation of the possible state transitions for a *Response*:

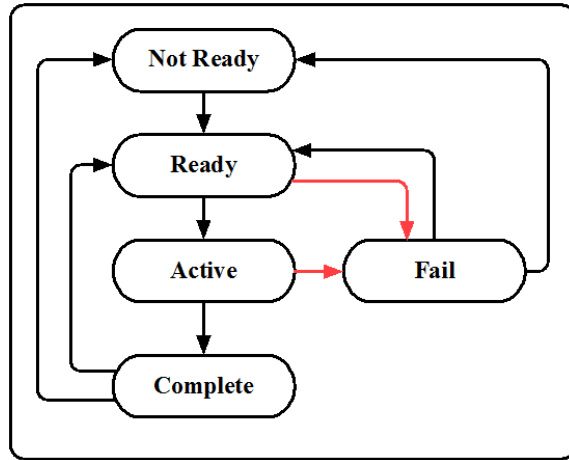

Figure 6: Response State Diagram

450 5 Operation and Error Recovery

451 The *Request/Response* state model implemented for *Interfaces* may also be represented by
 452 a graphical model. The scenario in *Figure 7* demonstrates the state transitions that occur
 453 during a successful *Request* for service and the resulting *Response* to fulfill that service
 454 *Request*.

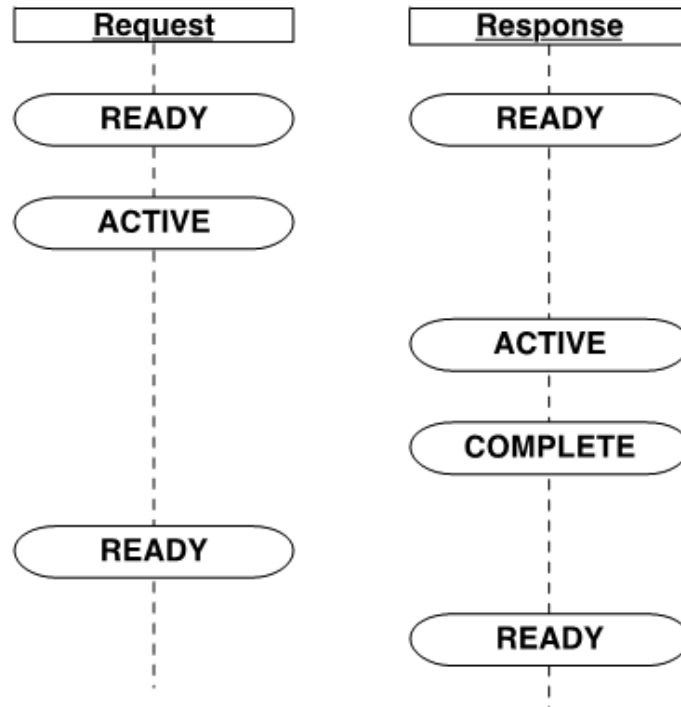

Figure 7: Success Scenario

455 5.1 Request/Response Failure Handling and Recovery

456 A significant feature of the *Request/Response Interaction Model* is the ability for either
 457 piece of equipment to detect a failure associated with either the *Request* or *Response* ac-
 458 tions. When either a failure or unexpected action occurs, the *Request* and the *Response*
 459 portion of the *Interaction Model* can announce a FAIL state upon detecting a problem. The
 460 following are graphical models describing multiple scenarios where either the *Requester*
 461 or *Responder* detects and reacts to a failure. In these examples, either the *Requester* or *Re-*
 462 *sponder* announces the detection of a failure by setting either the *Request* or the *Response*
 463 state to FAIL.

464 Once a failure is detected, the *Interaction Model* provides information from each piece of

465 equipment as they attempt to recover from a failure, reset all of their functions associated
466 with the *Interface* to their original state, and return to normal operation.

467 The following are scenarios that describe how pieces of equipment may react to different
468 types of failures and how they indicate when they are again ready to request a service or
469 respond to a request for service after recovering from those failures:

470 Scenario #1 – Responder Fails Immediately

471 In this scenario, a failure is detected by the *Responder* immediately after a *Request* for
472 service has been initiated by the *Requester*.

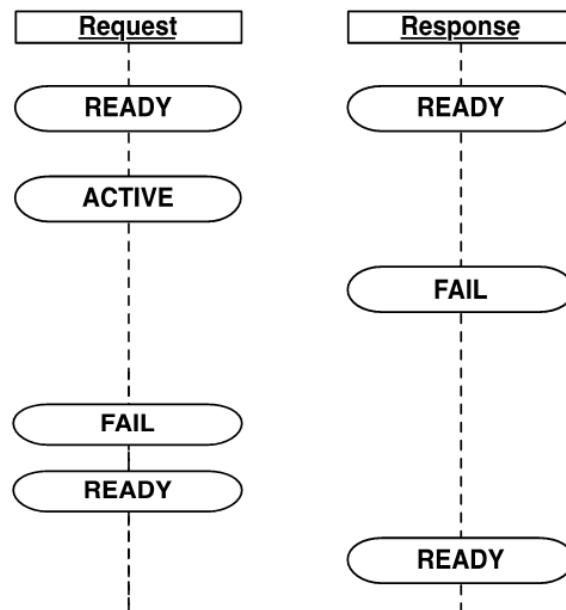

Figure 8: Responder - Immediate Failure

473 In this case, the *Request* transitions to ACTIVE and the *Responder* immediately detects
474 a failure before it can transition the *Response* state to ACTIVE. When this occurs, the
475 *Responder* transitions the *Response* state to FAIL.

476 After detecting that the *Responder* has transitioned its state to FAIL, the *Requester* **MUST**
477 change its state to FAIL.

478 The *Requester*, as part of clearing a failure, resets any partial actions that were initiated
479 and attempts to return to a condition where it is again ready to request a service. If the
480 recovery is successful, the *Requester* changes its state from FAIL to READY. If for some
481 reason the *Requester* cannot return to a condition where it is again ready to request a
482 service, it transitions its state from FAIL to NOT_READY.

483 The *Responder*, as part of clearing a failure, resets any partial actions that were initiated
 484 and attempts to return to a condition where it is again ready to perform a service. If the
 485 recovery is successful, the *Responder* changes its *Response* state from FAIL to READY. If
 486 for some reason the *Responder* is not again prepared to perform a service, it transitions its
 487 state from FAIL to NOT_READY.

488 Scenario #2 – Responder Fails While Providing a Service

489 This is the most common failure scenario. In this case, the *Responder* will begin the
 490 actions required to provide a service. During these actions, the *Responder* detects a failure
 491 and transitions its *Response* state to FAIL.

Figure 9: Responder Fails While Providing a Service

492 When a *Requester* detects a failure of a *Responder*, it transitions its state from ACTIVE to
 493 FAIL.

494 The *Requester* resets any partial actions that were initiated and attempts to return to a
 495 condition where it is again ready to request a service. If the recovery is successful, the
 496 *Requester* changes its state from FAIL to READY if the failure has been cleared and it is
 497 again prepared to request another service. If for some reason the *Requester* cannot return
 498 to a condition where it is again ready to request a service, it transitions its state from FAIL
 499 to NOT_READY.

500 The *Responder*, as part of clearing a failure, resets any partial actions that were initiated
 501 and attempts to return to a condition where it is again ready to perform a service. If the
 502 recovery is successful, the *Responder* changes its *Response* state from FAIL to READY if

503 it is again prepared to perform a service. If for some reason the *Responder* is not again
 504 prepared to perform a service, it transitions its state from `FAIL` to `NOT_READY`.

505 Scenario #3 – Requester Failure During a Service Request

506 In this scenario, the *Responder* will begin the actions required to provide a service. During
 507 these actions, the *Requester* detects a failure and transitions its *Request* state to `FAIL`.

Figure 10: Requester Fails During a Service Request

508 When the *Responder* detects that the *Requester* has transitioned its *Request* state to `FAIL`,
 509 the *Responder* also transitions its *Response* state to `FAIL`.

510 The *Requester*, as part of clearing a failure, resets any partial actions that were initiated
 511 and attempts to return to a condition where it is again ready to request a service. If the
 512 recovery is successful, the *Requester* changes its state from `FAIL` to `READY`. If for some
 513 reason the *Requester* cannot return to a condition where it is again ready to request a
 514 service, it transitions its state from `FAIL` to `NOT_READY`.

515 The *Responder*, as part of clearing a failure, resets any partial actions that were initiated
 516 and attempts to return to a condition where it is again ready to perform a service. If the
 517 recovery is successful, the *Responder* changes its *Response* state from `FAIL` to `READY`. If
 518 for some reason the *Responder* is not again prepared to perform a service, it transitions its
 519 state from `FAIL` to `NOT_READY`.

520 Scenario #4 – Requester Changes to an Unexpected State While Responder is Providing
 521 a Service

522 In some cases, a *Requester* may transition to an unexpected state after it has initiated a

523 *Request* for service.

524 As demonstrated in *Figure 11*, the *Requester* has initiated a *Request* for service and its
 525 *Request* state has been changed to ACTIVE. The *Responder* begins the actions required to
 526 provide the service. During these actions, the *Requester* transitions its *Request* state back
 527 to READY before the *Responder* can complete its actions. This **SHOULD** be regarded as
 528 a failure of the *Requester*.

Figure 11: Requester Makes Unexpected State Change

529 In this case, the *Responder* reacts to this change of state of the *Requester* in the same way
 530 as though the *Requester* had transitioned its *Request* state to FAIL (i.e., the same as in
 531 Scenario #3 above).

532 At this point, the *Responder* then transitions its *Response* state to FAIL.

533 The *Responder* resets any partial actions that were initiated and attempts to return to its
 534 original condition where it is again ready to perform a service. If the recovery is successful,
 535 the *Responder* changes its *Response* state from FAIL to READY. If for some reason the
 536 *Responder* is not again prepared to perform a service, it transitions its state from FAIL to
 537 NOT_READY.

538 **Note:** The same scenario exists if the *Requester* transitions its *Request* state to NOT_
 539 READY. However, in this case, the *Requester* then transitions its *Request* state
 540 to READY after it resets all of its functions back to a condition where it is again
 541 prepared to make a *Request* for service.

542 Scenario #5 – Responder Changes to an Unexpected State While Providing a Service

543 Similar to Scenario #5, a *Responder* may transition to an unexpected state while providing
 544 a service.

545 As demonstrated in *Figure 12*, the *Responder* is performing the actions to provide a ser-
 546 vice and the *Response* state is ACTIVE. During these actions, the *Responder* transitions its
 547 state to NOT_READY before completing its actions. This should be regarded as a failure
 548 of the *Responder*.

Figure 12: Responder Makes Unexpected State Change

549 Upon detecting an unexpected state change of the *Responder*, the *Requester* transitions its
 550 state to FAIL.

551 The *Requester* resets any partial actions that were initiated and attempts to return to a
 552 condition where it is again ready to request a service. If the recovery is successful, the
 553 *Requester* changes its state from FAIL to READY. If for some reason the *Requester* cannot
 554 return to a condition where it is again ready to request a service, it transitions its state from
 555 FAIL to NOT_READY.

556 Since the *Responder* has failed to an invalid state, the condition of the *Responder* is un-
 557 known. Where possible, the *Responder* should try to reset to an initial state.

558 The *Responder*, as part of clearing the cause for the change to the unexpected state, should
 559 attempt to reset any partial actions that were initiated and then return to a condition where
 560 it is again ready to perform a service. If the recovery is successful, the *Responder* changes
 561 its *Response* state from the unexpected state to READY. If for some reason the *Responder*

562 is not again prepared to perform a service, it maintains its state as NOT_READY.

563 Scenario #6 – Responder or Requester Become UNAVAILABLE or Experience a Loss
 564 of Communications

565 In this scenario, a failure occurs in the communications connection between the *Responder*
 566 and *Requester*. This failure may result from the `InterfaceState` from either piece of
 567 equipment returning a value of `UNAVAILABLE` or one of the pieces of equipment does
 568 not provide a heartbeat within the desired amount of time (See *MTCConnect Standard Part*
 569 *1.0 - Overview and Fundamentals* for details on heartbeat).

Figure 13: Requester/Responder Communication Failures

570 When one of these situations occurs, each piece of equipment assumes that there has been
 571 a failure of the other piece of equipment.

572 When normal communications are re-established, neither piece of equipment should as-
 573 sume that the *Request/Response* state of the other piece of equipment remains valid. Both
 574 pieces of equipment should set their state to `FAIL`.

575 The *Requester*, as part of clearing its `FAIL` state, resets any partial actions that were
 576 initiated and attempts to return to a condition where it is again ready to request a service.
 577 If the recovery is successful, the *Requester* changes its state from `FAIL` to `READY`. If for
 578 some reason the *Requester* cannot return to a condition where it is again ready to request

579 a service, it transitions its state from FAIL to NOT_READY.

580 The *Responder*, as part of clearing its FAIL state, resets any partial actions that were
581 initiated and attempts to return to a condition where it is again ready to perform a service.
582 If the recovery is successful, the *Responder* changes its *Response* state from FAIL to
583 READY. If for some reason the *Responder* is not again prepared to perform a service, it
584 transitions its state from FAIL to NOT_READY.
